HUNTER COLLEGE OF THE CITY OF UNIVERSITY OF NEW YORK
HUNTER-BELLEVUE SCHOOL OF NURSING

PRECEPTOR EVALUATION OF STUDENT PERFORMANCE
COMMUNITY/PUBLIC HEALTH NURSING

Course: Nursing 771/772/773 Date: December 23, 2013

Semester: Fall 2013

Name of Preceptor: Monica Hidalgo / Deborah Acevedo, RN

Agency/Organization: NewYork-Presbyterian Hospital

Name of Student: [redacted]

Preceptor:
Please review this form with the student. It is the student's responsibility to submit the completed form to the Seminar Faculty who assigns a final grade and gives the completed form to the Course Faculty. Without this form, the student cannot pass the course.

Please rate the student's performance in each of the following areas on a scale of "1" to "10," with "1" representing the lowest levels of performance and "10" the highest.

		Rating (1 to 10)
1.	Professional appearance/manner/demeanor	8
2.	Motivation	9
3.	Self-directed resourcefulness	8
4.	Value of the contributions to the Agency	9
5.	Reliability/adherence to promised schedules	9
6.	Interpersonal skills	7 to 8
7.	Overall rating	8

Total number of Agency clinical hours completed: N/A

Preceptor's comments on particular areas of student growth and performance:

[redacted] has been a great addition to our team. With a member of the Outreach staff, she recently started to survey representatives of the service industry surrounding Cornell to gauge interest in and availability for health outreach programming. In the short weeks she has been engaged in this activity, she has had the opportunity to meet several business owners. It seems her comfort level with this interaction is increasing and has improved so much already. I look forward to seeing her continue this work and continue to improve the manner in which she engages with the individuals she meets.

Monica Hidalgo 12/23/14

Signature of Agency Preceptor Date

Student Comments:

[redacted] 12/23/14

Signature of Student Date

The section below is completed by the Hunter-Bellevue School of Nursing Seminar Faculty

Number of non-Agency clinical hours completed: 25
(conferences, CE, etc.)

Total Number of clinical hours completed: 167
(167 hours required)

Grade in clinical portion of course: Pass _____ Fail _____

Signature of Seminar Instructor Date

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Estevan	Sup Last Name:	Garcia

Organization:	Brookdale Hospital Medical center

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Excellent
Uses time effectively	Very good
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Very good
Effectiveness in oral communication	Very good
Ability to identify problems and proposes solutions	Very good
Overall quality or work produced	Excellent

B) Work Attitudes

Accepts responsibilities	Excellent
Takes initiative	Very good
Follows policies, rules, regulations, etc.	Very good
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Excellent

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Excellent
Supervisor	Excellent
Personnel from other organizations	Very good
Clientele	Very good
General public	N/A

D) Application of community Health Skills

Assessing health problems	Very good
Developing health objectives	Very good
Planning health programs/projects	Very good
Implementing programs/projects	Very good
Evaluating programs/projects	Very good
Developing budgets	N/A
Applying research methodologies	N/A
Compiling health data/statistics	Very good
Facilitating group process	Very good

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Very good
Sensitivity	Very good

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	M was motivated to learn the system at brookdale and worked on several projects both independently and as part of the performance improvement team. She is eager to participate in as many areas as possible to expand her capacity.
What are the areas needing improvement?	None
Other comments regarding the intern:	We enjoyed having her work with s and would recommend her for future employment if available within the organization.

Future Opportunities

Would you be willing to take another student next semester?	Yes

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Rohan	Sup Last Name:	Ellis

Organization:	Woodhull Medical and Mental Health Center

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Very good
Uses time effectively	Excellent
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Excellent
Effectiveness in oral communication	Excellent
Ability to identify problems and proposes solutions	Very good
Overall quality or work produced	Excellent

B) Work Attitudes

Accepts responsibilities	Excellent
Takes initiative	Excellent
Follows policies, rules, regulations, etc.	Very good
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Very good

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Excellent
Supervisor	Very good
Personnel from other organizations	Excellent
Clientele	Very good
General public	Excellent

D) Application of community Health Skills

Assessing health problems	Very good
Developing health objectives	Very good
Planning health programs/projects	Very good
Implementing programs/projects	N/A
Evaluating programs/projects	N/A
Developing budgets	N/A
Applying research methodologies	Good
Compiling health data/statistics	N/A
Facilitating group process	N/A

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Very good
Sensitivity	Very good

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	Mr B inquisitive nature perseverance thru difficult tasks, multi tasking and is overall knowledge regarding Public Health.
What are the areas needing improvement?	MR B is a excellent worker and so far working with him, he has performed all task giving with no errors
Other comments regarding the intern:	I believe Mr B is ready for the next leader is his career.

Future Opportunities

Would you be willing to take another student next semester?	Yes

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name: [redacted]	Int Last Name: [redacted]

Supervisor Information

Sup First Name: Leonardo	Sup Last Name: Vicente

Organization: HELP/PSI, INC.

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Excellent
Uses time effectively	Excellent
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Excellent
Effectiveness in oral communication	Very good
Ability to identify problems and proposes solutions	Excellent
Overall quality or work produced	Excellent

B) Work Attitudes

Accepts responsibilities	Excellent
Takes initiative	Excellent
Follows policies, rules, regulations, etc.	Excellent
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Excellent

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Excellent
Supervisor	Excellent
Personnel from other organizations	Excellent
Clientele	Excellent
General public	Excellent

D) Application of community Health Skills

Assessing health problems	Excellent
Developing health objectives	Excellent
Planning health programs/projects	Excellent
Implementing programs/projects	Excellent
Evaluating programs/projects	Excellent
Developing budgets	Excellent
Applying research methodologies	Excellent
Compiling health data/statistics	Excellent
Facilitating group process	Excellent

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	[redacted]s very flexible. He always is available whenever he is needed. He is a very personable individual.
What are the areas needing improvement?	[redacted]needs to gather his thoughts before he tries to communicate them so that he may effectively be able to transmit exactly what he is thinking. He has the ability to analyze a situation well and when he allows his mind to digest the situation he is able to formulate a sound solution.
Other comments regarding the intern:	[redacted]will be an asset in the healthcare industry because he is able to postulate and formulate concepts from many different perspectives.

Future Opportunities

Would you be willing to take another student next semester?	Yes

EVALUATION FORM - SUPERVISOR

Intern Information

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	Mr. B is a very intelligent, thoughtful and focused person. He is a quick learner and has shown in the quality of his work his regard for professional standard for both the work he did coordinating our Community Health Needs Assessment and as a health educator. He is well versed in public health matters affecting the population of the South Bronx and familiar with qualitative research techniques that can help elucidate the underlying nature of those matters for our clinician partners. Mr. B has had a very good relationship with the staff at The Bronx Health Link. He has a sharp wit and exhibits a warmth of character towards our colleagues.
What are the areas needing improvement?	I have not observed any areas that need improvement.
Other comments regarding the intern:	It has been a pleasure having Mr. B as an intern at The Bronx Health Link.

Future Opportunities

Would you be willing to take another student next semester?	Yes

HUNTER COLLEGE OF THE CITY OF UNIVERSITY OF NEW YORK
HUNTER-BELLEVUE SCHOOL OF NURSING

PRECEPTOR EVALUATION OF STUDENT PERFORMANCE
COMMUNITY/PUBLIC HEALTH NURSING

Course: Nursing 771/772/773 Date: December 2013

Semester: Fall Semester 2013

Name of Preceptor: Dr. Denise Paone, Director of Research and Surveillance
New York City Department of Health and Mental Hygiene
Agency/Organization: Bureau of Alcohol and Drug Use Prevention, Care, and Treatment

Name of Student: [redacted]

Preceptor:
Please review this form with the student. It is the student's responsibility to submit the completed form to the Seminar Faculty who assigns a final grade and gives the completed form to the Course Faculty. Without this form, the student cannot pass the course.

Please rate the student's performance in each of the following areas on a scale of "1" to "10," with "1" representing the lowest levels of performance and "10" the highest.

		Rating (1 to 10)
1.	Professional appearance/manner/demeanor	10
2.	Motivation	10
3.	Self-directed resourcefulness	9
4.	Value of the contributions to the Agency	9
5.	Reliability/adherence to promised schedules	10
6.	Interpersonal skills	9
7.	Overall rating	9.5

Total number of Agency clinical hours completed: 167

Preceptor's comments on particular areas of student growth and performance:

[redacted] is a great asset to our research/surveillance team. She is highly motivated and shows great interest in the content - drug use and drug epidemiology in NYC. [redacted] approaches her tasks with determination; she pays great attention to detail and completes all of her assignments in a timely fashion. [redacted] is open to new experiences; she asks questions appropriately. Overall, [redacted] is a delight to work with and we are looking forward to our ongoing relationship.

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Shari	Sup Last Name:	Suchoff

Organization:	Maimonides Medical Center

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Very good
Uses time effectively	Good
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Good
Effectiveness in oral communication	Good
Ability to identify problems and proposes solutions	Good
Overall quality or work produced	Very good

B) Work Attitudes

Accepts responsibilities	Very good
Takes initiative	Good
Follows policies, rules, regulations, etc.	Good
Graciously accepts ideas and suggestions	Very good
Perfoms tasks with industry and drive	Very good

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Good
Support staff	Good
Supervisor	Good
Personnel from other organizations	N/A
Clientele	N/A
General public	N/A

D) Application of community Health Skills

Assessing health problems	N/A
Developing health objectives	N/A
Planning health programs/projects	Good
Implementing programs/projects	Good
Evaluating programs/projects	Good
Developing budgets	N/A
Applying research methodologies	N/A
Compiling health data/statistics	Very good
Facilitating group process	Good

E) Personal Characteristics

Dependability	Very good
Tactfulness	Good
Listening ability	Very good
Sensitivity	Good

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Good
What are the outstanding strengths of the intern?	L's work was always good, and he communicated well about his progress and timelines. He met his deadlines and was punctual. He showed interest in the work he was doing here.
What are the areas needing improvement?	L needs to continue to improve his interpersonal skills, although he did make noticeable progress over the course of his internship.
Other comments regarding the intern:	L responded well to our midterm evaluation, and improved considerably on his interpersonal skills.

Future Opportunities

Would you be willing to take another student next semester?	Yes

Comment:

1. J had strong skills in research and writing. She was a good learner who was able to integrate and manipulate information in an effective manner. She was able to complete three major assignments while at the Alliance including two webinars on material that was relatively new to her. She researched the topics carefully, located speakers and managed their presentations in a professional and intelligent fashion. The webinars were very successful and received good evaluations from the participants.

2. J had difficulty estimating how long a task would take her. Her supervisor would help her come up with a list of tasks for accomplishing the Webinars and a timeline for their completion. Admittedly, the topics were challenging and required background research and the assimilation of a fair amount of material. However,, this was cooperative process during which there were multiple check-ins and supports offered. Despite this, J had difficulty estimating how long a task would take and accomplishing her task within the timeframe outlined. Though the Webinars were both completed by the assigned time, it made those around her anxious as to whether they would be done in time.

3. J's work with the Alliance was more challenging than ordinarily because of a transition in staff. About half way through her tenure at the Alliance, her supervisor decided to leave for important career opportunity. As a result, she worked under the supervision of the Executive Director for one month until her supervisor was replaced. Then she worked with a new supervisor for the last two months of her stay. She was a good sport about these transitions and communicated that she learned from each of her supervisors and seemed to think that the experience was a good one.

7.	Overall rating	10

Total number of Agency clinical hours completed: 174

Preceptor's comments on particular areas of student growth and performance:

It has been a wonderful experience working with [redacted] in her clinical work at the Center for Comprehensive Health Practice. She has spend a majority of her time here working on our Hypertension, Asthma, and Diabetes (HAD) program, which we began 3 years ago to address the educational and preventive needs of our patients with these chronic illnesses. Throughout her time here [redacted] and I have worked together to restructure this program into educational groups (previously only one-on-one education was done), medically supervised with monthly gathered patient data such as BMI.

Compiling health data/statistics	N/A
Facilitating group process	N/A

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	A has a great rapport with community members and was able to establish most of the program's non-traditional partnerships for condom distribution. She is extremely productive, conveys her enthusiasm for the project to the community, and is a delight to work with.
What are the areas needing improvement?	None.
Other comments regarding the intern:	I have to say that A contributed tremendously to our program. We were struggling at start-up to get enough businesses to buy into our condom distribution program. She just went out into the community and doggedly recruited the majority of our partners - about 130 in total. I see a great future for her as a public health leader and would love to work with her again sometime.

Future Opportunities

6. Interpersonal skills 10
7. Overall rating 47

Total number of Agency clinical hours completed (see logs submitted by student) 144 hours

Preceptor's comments on particular areas of Student growth and performance:

When I first met [redacted] at the start of this experience, she did not yet have a clear vision of her purpose and goals for this community rotation. Together with her professor we had all agreed that she first be afforded an opportunity to be immersed in the homecare experience through observation of nurses in the field. She would also be given the opportunity to attend any continuing education programs being provided to the staff during this time frame. For this reason a specific "project" was not assigned, and I have not rated question #4.
I am very satisfied that this intensive exposure to observing the day to day activities and challenges to nurse in the field and the population being serviced has expanded [redacted] understanding of this specialized area of community health. She is beginning to see how intertwined all areas of the health care system are, the clinical, the financial, the political…..She has in the course of her experiences enthusiastically identified an area she would like to concentrate on for the next two semesters and has begun independently researching the topic of self efficacy in breastfeeding. She has been asking good questions and takes advantage of any opportunity she can to learn and develop her professional expertise in nursing.

Her attendance was reliable and if something came up she clearly communicated to reschedule in a timely fashion.
I would like to see her begin to take a stronger lead now, as we continue to support and guide her, with ideas as to how she can move forward with a community health project. I see many exciting possibilities which can be of benefit to our maternity and pediatric program and hope to flesh something out together with her at our next meeting. We have been placing a greater emphasis on successful breastfeeding especially as we develop postpartum visit packages. Our nurses are in the process of all becoming lactation certified.
I hope to see her continue to grow and develop into a more confident advance practice nurse.

HEALTH POLICY AND MANAGEMENT
Fieldwork Preceptor Evaluation Form

Student: [redacted] Preceptor: Mina Fasolo

Name of Agency: NYC Department of Health and Mental Hygiene, Division of Mental Hygiene, Bureau of Children, Youth, and Families, Office of Policy and Planning Dates of Placement: 7/8/13 To: 9/6/13

Please check one box in each row

	Excellent (Performs on a Level that is Professional)	**Above Average**	**Average** (Needs to Improve)	**Below Average**	No Opportunity To Observe
PROFESSIONAL QUALITIES					
1. **Appreciation and knowledge of:**					
a) Technical & political climate within which agency works	X				
b) Principles and concepts related to policy development		X			
c) Concepts and procedures related to management					X
2. Skills in:					
a) Assessment					X
b) Evaluation		X			
c) Budgetary processes					X
d) Policy implementation		X			
e) Writing		X			
f) Oral communication	X				
g) Collaborative team work	X				
OVERALL PERFORMANCE					
1. Establishes collegial relationship with co-workers	X				
2. Organizes and uses time effectively	X				
3. Listens attentively		X			
4. Facilitates work of program	X				
5. Submits accurate, well documented work and reports	X				
6. Accepts responsibility and completes work assignments	X				
7. Shows creativity or innovativeness	X				

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. Special strengths:

   Daniel was a pleasure to work with. He demonstrated a professional and collegial presence within our office, a very good understanding of our topic areas, and excellent critical thinking skills. Daniel showed strong self-motivation when given tasks that were new to him, and took initiative to research information to raise his level of understanding when needed.

2. Skills and knowledge needing further improvement:

3. Other comments:

Preceptor's Signature Mina Fasolo **Date** 10/17/13

You are encouraged to discuss this evaluation with the student.

HUNTER COLLEGE OF THE CITY OF UNIVERSITY OF NEW YORK
HUNTER-BELLEVUE SCHOOL OF NURSING

PRECEPTOR EVALUATION OF STUDENT PERFORMANCE
COMMUNITY/PUBLIC HEALTH NURSING

Course: Nursing 771/772/773 Date 12/18/13

Semester: Fall 2013

Name of Preceptor: [illegible]

Agency/Organization: [illegible]

Name of Student: [redacted]

Preceptor:
Please review this form with the student. It is the student's responsibility to submit the completed form to the Seminar Faculty who assigns a final grade and gives the completed form to the Course Faculty. Without this form, the student cannot pass the course.

Please rate the student's performance in each of the following areas on a scale of "1" to "10," with "1" representing the lowest levels of performance and "10" the highest.

		Rating (1 to 10)
1.	Professional appearance/manner/demeanor	9
2.	Motivation	10
3.	Self-directed resourcefulness	9
4.	Value of the contributions to the Agency	9
5.	Reliability/adherence to promised schedules	10
6.	Interpersonal skills	10
7.	Overall rating	10

Total number of Agency clinical hours completed: 104

Preceptor's comments on particular areas of student growth and performance:

[redacted] has been a welcomed asset to the team. Her enthusiasm to the work has been instrumental in helping to get key projects off the ground. I look forward to seeing as she becomes more involved in her projects.

Signature of Agency Preceptor — Date 12/18/13

Student Comments:

4.	Value of the contributions to the Agency	10
5.	Reliability/adherence to promised schedules	10
6.	Interpersonal skills	10
7.	Overall rating	10

Total number of Agency clinical hours completed 145.9

Preceptor's comments on particular areas of student growth and performance

[redacted] vastly expanded her knowledge of Breastfeeding practices, policies and procedures which includes Baby Friendly Hospital Initiative (BFHI): appropriate latch-on, positioning; cues; hand expression recommendation for exclusive breastfeeding for six months and interviewing. She also supervised undergraduate nursing students and delegation of assignments. She showed initiative as was demonstrated through patients/clients teaching without close supervision.

[redacted] conducted research literature review about the impact of prenatal Breastfeeding Education on breastfeeding outcomes in preparation for writing a grant proposal.

Laurel L. Maulucci 12/20/13

Signature of Agency Preceptor Date

Student Comments

This clinical offered a wide range of learning experiences that allowed for me to refine some of my existing skills and to acquire and advance on Public Health Nursing skills and outlook.

Preceptor's comments on particular areas of student growth and performance:

[redacted] is a thoughtful, hardworking student who is committed to any task I give her. We have spent this first semester together reviewing & discussing the HIV/AIDS epidemic as it relates to the NYC HIV Surveillance System. [redacted] is participating in a new project this Summer in our Bureau so we are now legally able to provide HIV-Surv data at both the family and individual level. [redacted] first assist with gathering clinical info on PLWH after we will be providing faculty-level data to her. She contacted client site and requested [illegible] data Saskatoon 12/20/2013

Signature of Agency Preceptor Date

Student Comments: [redacted] is polite, professional and courteous. In addition to her high level of professionalism she has helped to make great headway on this needed project. I look forward to working with her [redacted] as she is a great addition

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Rupa	Sup Last Name:	Mehta
Organization:	NaliniKIDS		

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Excellent
Uses time effectively	Excellent
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Excellent
Effectiveness in oral communication	Excellent
Ability to identify problems and proposes solutions	Excellent
Overall quality or work produced	Excellent

B) Work Attitudes

Accepts responsibilities	Excellent
Takes initiative	Excellent
Follows policies, rules, regulations, etc.	Excellent
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Excellent

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Excellent
Supervisor	Excellent
Personnel from other organizations	Excellent
Clientele	Excellent
General public	Excellent

D) Application of community Health Skills

Assessing health problems	Excellent
Developing health objectives	Excellent
Planning health programs/projects	Excellent
Implementing programs/projects	Excellent
Evaluating programs/projects	Excellent
Developing budgets	Excellent
Applying research methodologies	Excellent
Compiling health data/statistics	N/A
Facilitating group process	Excellent

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	E is a dedicated self-starter, intelligent, honest and exceptionally ambitious. These attributes combined with her vibrancy make her extremely professional and a very capable and valuable team member and leader. Her background and passion for education, finance, and public health have all directly led to efficiently and effectively scaling the NaliniKIDS program. Her creativity, patience, organizational skills, confidence, and strong and clear communication skills have allowed her the ability to control and handle various dynamics and be an effective strategist and leader. Her natural talents and abilities are admirable and combined with her education and expertise has highly contributed to our successful progress.
What are the areas needing improvement?	To be honest, none. She has an uncanny ability to take a potential weakness, self-correct it and make it her greatest strength.
Other comments regarding the intern:	

Future Opportunities

Would you be willing to take another student next semester?	Yes

Facilitating group process	Good

E) Personal Characteristics

Dependability	Good
Tactfulness	Good
Listening ability	Good
Sensitivity	Good

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Good
What are the outstanding strengths of the intern?	S was motivated to learn and grow. Health care is new to her so she needed time learning to navigate the system and prioritize. She has great communication skills, a quick learner, wants to take on a diverse role and is ambitious. She questions and has great suggestions.
What are the areas needing improvement?	Needs to be able to follow through on projects more independently and aggressively. In public health and administration you have to learn how to be persistent to get things done. She can also be more innovative and come up with her own ideas and write ups. Organization skills when dealing with a variety of different groups and organizations could be improved over time in a real working environment out of the classroom.
Other comments regarding the intern:	Great potential. Works well in a team. Pleasant and easy to relate to . Culturally sensitive and interacts well with patients and families. I would like to see her focus more on self initiative and growth she is capable of. She could also focus on reviewing the literature and reading more on her projects at hand.

Preceptor's comments on particular areas of student growth and performance:

Received on 12/19/2013 2:46:02 PM

Alan Cox-Ballard 12.19.13

Signature of Agency Preceptor Date

Student Comments: I gained tremendously during the clinical seminar for this semester, fall 2013. In this clinical seminar, I am able to use data collection to evaluate the practice environment and quality of nursing care rendered in relation to existing evidence. I have been able to assess, evaluate and provide comments on data reviews that are part of the important projects that I am privilege to work on along with the supervision of my preceptor. I learned how projects are being developed to promote and enhance better client's outcomes at VNSNY. I hope to continue to develop in future clinical seminar at the agency.

HUNTER COLLEGE OF THE CITY OF UNIVERSITY OF NEW YORK
HUNTER-BELLEVUE SCHOOL OF NURSING

PRECEPTOR EVALUATION OF STUDENT PERFORMANCE
COMMUNITY/PUBLIC HEALTH NURSING

Course: Nursing 771/772/773 Date: 12/10/13

Semester: Fall 2013

Name of Preceptor: Ana Marin

Agency/Organization: New York Presbyterian Hospital Center for Community Health and Education

Name of Student: [redacted]

Preceptor:
Please review this form with the student. It is the student's responsibility to submit the completed form to the Seminar Faculty who assigns a final grade and gives the completed form to the Course Faculty. Without this form, the student cannot pass the course.

Please rate the student's performance in each of the following areas on a scale of "1" to "10," with "1" representing the lowest levels of performance and "10" the highest.

		Rating (1 to 10)
1.	Professional appearance/manner/demeanor	10
2.	Motivation	10
3.	Self-directed resourcefulness	08
4.	Value of the contributions to the Agency	09
5.	Reliability/adherence to promised schedules	08
6.	Interpersonal skills	10
7.	Overall rating	09

Total number of Agency clinical hours completed: 142 hrs.

Preceptor's comments on particular areas of student growth and performance:

It has been a pleasure having [redacted] on our clinic. She has great energy and is motivated. [redacted] began the semester feeling shy and hesitant to figure out how to communicate her ideas. However by October this had quickly changed. [redacted] became comfortable in engaging students without my presence and expressing her thoughts and these interactions. We worked together to formalize a plan towards which schools to target and I appreciated the initiative she took in sending emails, replying and setting up meetings. I know [redacted] wants to fine tune her public speaking skills and I have no doubt this is something that she will improve next semester. As I mentioned to her just today - I have been very impress with her desire to lead particular sections of the workshops despite feeling nervous. I look forward to working with [redacted] next semester!

Ana Marie — 12/10/13

Signature of Agency Preceptor — Date

Signature of Student — Date

The section below is completed by the Hunter-Bellevue School of Nursing Seminar Faculty

Number of non-Agency clinical hours completed: _____ (conferences, CE, etc.)

Total Number of clinical hours completed: _____ (167 hours required)

Grade in clinical portion of course: Pass _____ Fail _____

Signature of Seminar Instructor — Date

PRECEPTOR EVALUATION FORMS

(Note: Each Campus / Specialization within CUNY SPH @ Hunter has a Unique Forms)

PUBLIC HEALTH NUTRITION

Fieldwork Preceptor Evaluation Form

Student: [redacted] Preceptor: Alex Lutz

Name of Agency: American Red Cross Dates of placement: 7/30/18 to 12/30/18

	Please check one box in each row.				
	Excellent (performs on a level that is highly professional)	**Above average**	**Average** (needs to improve)	**Below average**	No opportunity to observe
PROFESSIONAL QUALITIES					
1. Appreciation and knowledge of:					
a) Technical & political climate within which agency works	X				
b) Health education principles and concepts	X				
2. Skills in:					
a) Planning	X				
b) Implementation	X				
c) Organizing	X				
d) Program analysis and evaluation	X				
e) Writing	X				
f) Verbal communication	X				
g) Nutrition counseling/education	X				
OVERALL PERFORMANCE					
1. Establishes friendly relationship with co-workers.	X				
2. Organizes and uses time effectively.	X				
3. Considers and incorporates the ideas of others	X				
4. Is able to facilitate work of committees and other groups.	X				
5. Submits accurate, well documented work and reports.	X				
6. Accepts responsibility and completes work assignments	X				
7. Raises innovative ideas and brings out creative and innovative ideas in others	X				

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. Special strengths: [redacted] has shown a great ability to work independently and multi-task. Her planning concept to create a new children's program for the Greater New York chapter is well thought out and included several components that were not considered by myself when first discussed. She has also gone to great lengths to work with the chapter's volunteer resources department to recruit volunteers to provide input on the first draft concept of the program.
2. Skills and knowledge needing further improvement: None that I have observed.
3. Other comments: [redacted] was tasked with working on a new children's program and went well beyond what was originally discussed or conceived. Her concept impressed our Chief Operations Officer who is a 20 year Red Cross employee and who has overseen children's programs herself. [redacted]'s brilliant thoughtfulness, planning and attention to detail has enabled me to let her work almost completely independent at times and I have used [redacted] as an example to other departments on the tremendous

benefits that come from engaging volunteers to assist in our everyday operations. [redacted] has also taken time to work outside her position and learn more about the Red Cross, for example, going on a ride along with our disaster responders to the scene of a local emergency. [redacted] easy ranks at the top of the class when I consider the interns I have had in my eight years at the Red Cross.

Preceptor Signature _____ **Date:** 12/11/13

You are encouraged to discuss this evaluation with the student.

[redacted] IS A TEAM PLAYER AND HAS BROUGHT VALUE TO THE PROJECT HE IS WORKING ON. HOWEVER, BECAUSE OF HIS OTHER EMPLOYMENT COMMITTMENTS, [redacted] HAS BEEN UNABLE TO MAINTAIN A REGULAR SCHEDULE WITH OUR OFFICE WHICH SOMETIMES HINDERS THE PROGRESS OF THE PROJECT. [redacted] MUST ALSO WORK ON COMMUNICATING WORK CONFLICTS IN A MORE PROFESSIONAL AND TIMELY MANNER.

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Yma	Sup Last Name:	Andries

Organization:	New York City Department of Health and Mental Hygiene

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Very good
Uses time effectively	Excellent
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Excellent
Effectiveness in oral communication	Excellent
Ability to identify problems and proposes solutions	Excellent
Overall quality or work produced	Excellent

B) Work Attitudes

Accepts responsibilities	Excellent
Takes initiative	Excellent
Follows policies, rules, regulations, etc.	Excellent
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Excellent

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Excellent
Supervisor	Excellent
Personnel from other organizations	Excellent
Clientele	Excellent
General public	Excellent

D) Application of community Health Skills

Assessing health problems	N/A
Developing health objectives	N/A
Planning health programs/projects	Excellent
Implementing programs/projects	Excellent
Evaluating programs/projects	Very good
Developing budgets	N/A
Applying research methodologies	Excellent
Compiling health data/statistics	N/A
Facilitating group process	N/A

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	V has been extremely hands-on in every aspect of this project. She has brought up ideas that have been implemented, such as changes to the data collection form. She has made suggestions in terms of how the work can be operationalized and what makes practical sense in the field.
What are the areas needing improvement?	V has really been a pleasure to work with since the inception of the project. She has no problem explaining her point of view and reasoning behind her suggestions. There were no identifiable areas needed for improvement.
Other comments regarding the intern:	V is not only enthusiastic about the project, she has come with well-though out solutions to issues that have come up. She has been vital to the smooth running of the pilot project and her work will help to shape, she has worked well as part of the team, but has also demonstrated the capacity to work individually without constant supervision.

Future Opportunities

Would you be willing to take another student next semester?	Yes

EVALUATION FORM - SUPERVISOR

Evaluating programs/projects	Excellent
Developing budgets	Very good
Applying research methodologies	Very good
Compiling health data/statistics	Excellent
Facilitating group process	Excellent

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	G is ready to give new ideas and insight from what he has learned in his public health background and is eager to implement them. He is highly dependable and reasons well with others. He has shown to be consistently motivated with his peers and superiors. G takes initiative with the bariatric patient safety project. His knowledge has been an asset to our program.
What are the areas needing improvement?	Overall, G has been an excellent intern with very few areas needing improvement. In the beginning of his internship I realized G had some difficulty balancing work, school, and the internship. Throughout the course of the internship he has developed ways of managing his schedule, to the point where he was able to successfully completed his internship work exceedingly well.
Other comments regarding the intern:	Would make an excellent asset in any organization.

Future Opportunities

Would you be willing to take another student next semester?	Yes

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Audrey	Sup Last Name:	Castillo

Organization:	Brooklyn DPHO, NYC DOHMH

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Good
Uses time effectively	Good
Reliably completes tasks on time	Good
Effectiveness in written communication	Good
Effectiveness in oral communication	Good
Ability to identify problems and proposes solutions	Fair
Overall quality or work produced	Good

B) Work Attitudes

Accepts responsibilities	Fair
Takes initiative	Good

Compiling health data/statistics	N/A
Facilitating group process	Good

E) Personal Characteristics

Dependability	Fair
Tactfulness	Good
Listening ability	Good
Sensitivity	Good

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Good
What are the outstanding strengths of the intern?	Ms. T wants to assure that she is on the right track with her work and solicits feedback as much as possible. She follows directions very well and is careful in performing every task as explained. She has taken initiative with one school and applied her own skills by translating their wellness policy to Arabic.
What are the areas needing improvement?	While sometimes she takes initiative, often following directions limits her from thinking outside of the box in terms of what creative solutions she can assist the schools in achieving their wellness goals. While she has been able to manage time with schools well, she has missed a planned meeting with the other interns. Mistakes happen but this would be unacceptable in a work setting.
Other comments regarding the intern:	Ms. T has really given a lot of her time and energy to the program and has been asset to her schools. As she grows as a public health professional, I hope that she trusts her instincts more and takes more initiative to explore the needs of whatever project she is working on and develop solutions.

Future Opportunities

Would you be willing to take another student next semester?	Yes

Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	During this past semester E developed many new skills. She was able to engage patients in a short period of time, provide education on pregnancy options and contraception. E was compassionate, actively listened and ensured patients questions were answered. E's major strengths are her diligence, organized and dependability. She communicated with patients in a non judgmental, empathetic and professional manner.
What are the areas needing improvement?	N/A
Other comments regarding the intern:	E did an outstanding job in her role at PPNYC.

Future Opportunities

Would you be willing to take another student next semester?	Yes

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	L is extremely reliable, personable, and independent. She is a quick learner and has a great rapport with patients and our staff.
What are the areas needing improvement?	If anything, I would say that L could improve her confidence in her in her interactions with patients. Engaging potential participants and completing the lengthy data collection visits can be challenging, but if you are confident in explaining the study and moving through the protocol, it makes everything run smoother. L has the potential to do this very well and I've seen improvement from when she first started to now.
Other comments regarding the intern:	None.

Future Opportunities

Would you be willing to take another student next semester?	Yes

ENVIRONMENTAL AND OCCUPATIONAL HEALTH SCIENCE
Fieldwork Preceptor Evaluation Form

Student: [redacted] Preceptor: David Olton

Name of Agency: NYC DEP Dates of Placement: 09/30/14 To 12/19/14

Please check one box in each row.

	Excellent (Performs on a Level that is Professional)	**Above Average**	**Average** (Needs to Improve)	**Below Average**	No Opportunity To Observe
PROFESSIONAL QUALITIES					
1. **Appreciation and knowledge of:**					
a) Technical & political climate within which agency works			X		
b) Principles and concepts related to policy development			X		
c) Concepts and procedures related to management			X		
2. **Skills in:**					
a) Assessment		X			
b) Evaluation		X			
c) Budgetary processes					X
d) Policy implementation					X
e) Writing		X			
f) Oral communication		X			
g) Collaborative team work		X			
OVERALL PERFORMANCE					
1. Establishes collegial relationship with co-workers		X			
2. Organizes and uses time effectively		X			
3. Listens attentively	X				
4. Facilitates work of program		X			
5. Submits accurate, well documented work and reports		X			
6. Accepts responsibility and completes work assignments		X			
7. Shows creativity or innovativeness		X			

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. **Special strengths:** Accountability, Multi-tasking, Commitment, Motivation
2. **Skills and knowledge needing further improvement:** Interpersonal skills, Teamwork and Collaboration skills, Communication skills (verbal, non-verbal, and written), Time Management Skills, Results Orientation Skills
3. **Other comments:** Please see below.

[redacted] is a versatile and highly motivated individual who has demonstrated a sincere willingness to assist the Office of Environmental Health and Safety's (EHS), EHS Management Systems Division (EHSMSD) complete our immediate tasks/projects to ensure fulfillment of our Division's long-term goal to measure and demand EHS success at the NYCDEP. As a result of [redacted]'s demonstrated commitment to assist EHSMSD, she successfully assisted EHSMSD in developing a comprehensive electronic document library of historical EHS Audit and Assessment reports (issued by our EHSMSD Audit Team from 2003 – 2014). Developing a document library was part of an overall *EHS Assessment Scheduling Initiative* formed to assist EHSMSD develop Annual EHS Assessment Schedules for the 2015 calendar year and onwards. The results of [redacted]'s efforts will also further enable EHSMSD to introduce a breakthrough online Microsoft SharePoint Document Library that will be easily accessible to all Agency EHS staff, and will be utilized as a primary website to obtain information for future EHS assessment planning initiatives. [redacted] also participated in the compilation and presentation of EHS post-assessment survey results to assist EHSMSD in reviewing trends and feedback received from our Bureau peers to continually improve our Audit Program. She also assisted in reconciling performance metrics data (i.e. review of injuries and illness logs, notices of violations, and motor vehicle collision reports) to finalize our Fiscal Year 2015 1st Quarter Agency EHS Performance Report.

Future Performance Planning:

[redacted] exhibits good listening skills, comprehends complex EHS subject matters well, and is willing to complete her assignments under strict deadlines. With opportunities for continued exposure to a professional work environment, it is anticipated that [redacted] will continue to strengthen her technical and management level skills for continued success in her future career endeavors.

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Wayne	Sup Last Name:	Gietz

Organization:	Brookdale Hospital Medical Center

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Excellent
Uses time effectively	Very good
Reliably completes tasks on time	Very good
Effectiveness in written communication	Very good
Effectiveness in oral communication	Very good
Ability to identify problems and proposes solutions	Excellent
Overall quality or work produced	Excellent

B) Work Attitudes

Accepts responsibilities	Very good
Takes initiative	Very good
Follows policies, rules, regulations, etc.	Excellent
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Excellent

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Very good
Supervisor	Excellent
Personnel from other organizations	Excellent
Clientele	Excellent
General public	Excellent

D) Application of community Health Skills

Assessing health problems	Very good
Developing health objectives	Very good
Planning health programs/projects	Very good
Implementing programs/projects	Very good
Evaluating programs/projects	Very good
Developing budgets	Very good
Applying research methodologies	Very good
Compiling health data/statistics	Very good
Facilitating group process	Excellent

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	Ms. D is a very thoughtful and well rounded leader.
What are the areas needing improvement?	Ms. D needs to continue to develop her understanding of healthcare delivery systems.
Other comments regarding the intern:	Ms. D is a complete pleasure to work with.

Future Opportunities

Would you be willing to take another student next semester?	Yes

EPIDEMIOLOGY/BIOSTATISTICS
Fieldwork Preceptor Evaluation Form

Student: [redacted] Site Supervisor: Levi Waldron

Name of Agency: CUNY School of Public Health, Hunter College Dates of placement: Sept 2014 – May 2015

	Please check one box in each row.				
	Excellent (performs on a level that is highly professional)	**Above average**	**Average** (needs to improve)	**Below average**	No opportunity to observe

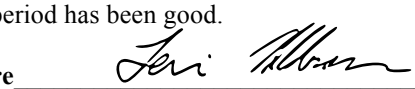
OVERALL PERFORMANCE					
1. Establishes friendly relationship with co-workers.		X			
2. Organizes and uses time effectively.				X	
3. Considers and incorporates the ideas of others		X			
4. Is able to facilitate work of committees and other groups.					X
5. Submits accurate, well documented work and reports.		X			
6. Accepts responsibility and completes work assignments				X	
7. Raises innovative ideas and brings out creative and innovative ideas in others			X		

COMMENTS (Please respond briefly. Use reverse side if necessary):



1. Special strengths: Final results are well-organized and readable.

2. Skills and knowledge needing further improvement:

Ability to meet deadlines and agreed-upon milestones needs work. The final fieldwork output is significantly less, and took much longer, than originally anticipated.

3. Other comments:

Work responsibilities have limited Jasmine's ability to fully participate in fieldwork, but the quality of what she was able to produce during the period has been good.

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	Ms. G is excellent at managing her time, and completing tasks with extreme effectiveness. Her strengths include her communication skills, and her ability to pull clinical and administrative data from different statistical reports. She also displays professionalism, and a drive to learn.
What are the areas needing improvement?	Ms. G can improve on following up with other entities within the hospital, since they give extreme push back when it comes to completing tasks.
Other comments regarding the intern:	She was able to complete a semesters workload within a couple of months, and I was extremely impressed with the finish product. Her work has really helped me with my program within the hospital, and her extent of knowledge in research has also helped the program immensely.

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	During her internship Ms. K was assigned to a variety of community engagements that she approached with professionalism and enthusiasm. She gained knowledge about HIV/STD to effectively answer questions when asked. She was always on time and delivered her paper work as requested. She also served and filed program documents, and assisted with some clerical duties. Ms. K proved to be an effective, highly conscientious and eager intern. She had no difficulty in adapting and was culturally competent regarding the population that our Condom Distribution Program targeted: people at high risk for HIV and STIs. She was very capable of working independently, seeking directions when necessary. One of Ms. K biggest strengths was that she made a greater effort to make sure that programs goals were a
What are the areas needing improvement?	I hope she continues taking on gradual initiative roles that I believe will prepare her for a management position in the future. Also, she should strive to constantly improve by keeping herself informed and gaining knowledge, as Public Health is a changing field with new findings and different approaches to improve the health and quality of life of communities in need.
Other comments regarding the intern:	Ms. K became an important member of our HIV/STI prevention team with her willingness to learn and dedication to help the Program success in its very important goals: to raise the profile of the DOH NYC condom initiative and raise awareness in the acceptance of condoms in the communities more affected by HIV/STIs in Brooklyn. Ms. K can be a key member to any team where she is assigned to.

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	Mrs. K has been an excellent addition to CAMBA's Community initiative. Since the very beginning Mrs. K has showed great interest in the program and in the community that our program serves. Mrs. K has worked hard by no only visiting our non traditional sites but she has been a key component in the preparation of our Condom Distribution program documentation. Mrs. K has always accepted the program's challenges very gracious and a professional way, always looking for a solution. Mrs. K was assigned to a task that was new to the program a " Quality Assurance Survey" to be administer to our Non-Traditional-Sites (NTS) She responded w and accepted the new challenge.
What are the areas needing improvement?	Mrs. K, should keep herself focus in overcome cultural and languages barriers. However, she has done it in a very professional way. I am please to report that Mrs. K push herself to excel and that she will always will find areas to improve because she wants to learn.
Other comments regarding the intern:	Mrs. K has been an important member of our HIV/STI prevention team with her willingness and dedication to help the Program success. Mrs. K will be a great asset to any assignment/ task or program because she put her mind into it, focus in the goals and has a determination that any team will appreciate . Mrs. K is a fast learner and her curiosity and tenancy will be her biggest strength once she is in th Public Health field.

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	K is fully committed to what she sets out to accomplish as she has surpassed our expectations in such a short. Furthermore, she has made a positive impression on our Community Pediatrics Director. She excels in the following areas: Responsibility- She consistently reports to work on time. She submits her work in a timely and diligent manner. Personable and Professional-She exhibits strong interpersonal skills as she relates with her peers, hospital staff, patients and hospital leaders. Innovative-She thoroughly examines challenges and offers tangible solutions that are also innovative.
What are the areas needing improvement?	None that I have noted as of yet.
Other comments regarding the intern:	Despite the fact that K has had personal hardship, she has fulfilled her responsibilities in a dedicated and professional manner. I am confident that she will excel in the field of public health.

4. Facilitates work of program	X				
5. Submits accurate, well documented work and reports		X			
6. Accepts responsibility and completes work assignments	X				
7. Shows creativity or innovativeness	X				

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. Special strengths: This fall, DOHMH Incident Command System was activated to respond to the Ebola crisis. [redacted] was tasked with a variety of projects including gathering data about travelers returning from affected countries in Africa who are being monitored for Ebola symptoms and preparing reports that go to City Hall and NYPD. He completed his assignments quickly and accurately. [redacted] performed extremely well during the activation, where priorities are constantly changing and working quickly and efficiently is key.
2. Skills and knowledge needing further improvement: Overall [redacted] is very attentive and submits accurate work but he could improve on his attention to detail to his work.
3. Other comments: [redacted] work performance is very professional and he fits in with the staff extremely well. We are so fortunate to have [redacted] as part of our team.

g) Collaborative team work			X		
OVERALL PERFORMANCE					
1. Establishes collegial relationship with co-workers		X			
2. Organizes and uses time effectively			X		
3. Listens attentively			X		
4. Facilitates work of program			X		
5. Submits accurate, well documented work and reports		X			
6. Accepts responsibility and completes work assignments			X		
7. Shows creativity or innovativeness			X		

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. **Special strengths:**
   - [redacted] did a good job rehearsing the Hazcom training and practicing the respirator fit test procedure several times in order to gain confidence before presenting to Park employees.
   - [redacted] completed a thorough update of the chemical inventory by visiting all buildings and rooms in the park.
   - [redacted] was open to receiving feedback, and acted on suggestions made by the EH&S Director and EH&S Specialist.
   - [redacted] demonstrated patience and professionalism, and was well liked by the Park staff she encountered.

2. **Skills and knowledge needing further improvement**:
   - Notes and documentation [redacted] would benefit from taking more notes during meetings and documenting her work instead of relying on memory which, for example, led her to report to the wrong location on 6/25/14 to meet the EH&S Director costing her a one hour delay.
   - [redacted] could take more initiative to advance projects. For example, one main topic of her internship involved the Hazcom/GHS program and its requirements. During her inventory work, [redacted] identified 35 containers with missing or faded labels, but she did not incorporate in her schedule a task to address those containers by adding or updating those labels. Correcting such a deficiency on the spot or shortly after discovery would have greatly improved the program.
   - Interns should strive to take advantage of as many learning opportunities as possible. [redacted] declined participation in an interesting noise survey at 7 AM on 8/27/14, but did not explain why.

3. **Other comments**:
   - **Punctuality**:
     [redacted] was punctual with the exception of a notable occasion on 8/26/14 when she was late for a Bloodborne Pathogens (BBP) training session where she was to be one of three instructors.
   - **Training**:
     [redacted] self-confidence as a trainer/speaker increased as she rehearsed her training material. She could consult other resources to further improve her skills in preparing and delivering training. There are many resources on this topic such as: http://trainingtoday.blr.com/employee-training-resources/Prepare-for-Training.
     In addition to gaining confidence with the material, a trainer must also prepare for a training session by checking out the space, testing the training equipment (AV, projector, etc.), and preparing at least one backup system (thumb drive, hard copy). [redacted] did not have a backup copy of her internship summary presentation on her last day and risked being unable to present the information.

Overall:
[redacted] contributed positively to the Environmental Health and Safety program, specifically to the Hazcom and Hearing Loss Prevention programs and I hope she gained valuable knowledge and skills that will allow her to determine which area of Environmental Safety and Health she will pursue further.

Preceptor's Signature: **Date**: 9/4/2014

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Good
What are the outstanding strengths of the intern?	Ms R biggest strength has been promoting the program and willingness to do street outreach. Also, network with partners through participating in community events and make herself available for when is need it. Juggle her hectic schedule.
What are the areas needing improvement?	Mrs. R can make some improvement taking independent actions to achieve goals assigned by planning activities and using time efficiently. Looks for and takes advantage of opportunities; Asks for and offers help when needed.
Other comments regarding the intern:	Ms. R is a hard worker that with time and gaining experience she will be able to reach desired goals.

Future Opportunities

Would you be willing to take another student next semester?	Yes

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Sarah	Sup Last Name:	Wolf

Organization:	NYC Department of Health and Mental Hygiene

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Very good
Uses time effectively	Excellent
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Very good
Effectiveness in oral communication	Excellent
Ability to identify problems and proposes solutions	Excellent
Overall quality or work produced	Very good

B) Work Attitudes

Accepts responsibilities	Excellent
Takes initiative	Excellent
Follows policies, rules, regulations, etc.	Excellent
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Excellent

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Excellent
Supervisor	Excellent
Personnel from other organizations	Excellent
Clientele	N/A
General public	Excellent

D) Application of community Health Skills

Assessing health problems	Very good
Developing health objectives	N/A
Planning health programs/projects	Very good
Implementing programs/projects	Very good
Evaluating programs/projects	Excellent
Developing budgets	N/A
Applying research methodologies	Excellent
Compiling health data/statistics	Very good
Facilitating group process	N/A

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	M has a great personality for the professional world which will take her far here at the Health Dept where relationships are so important. She is upbeat, positive, thoughtful is always looking for solutions for problems that arise.
What are the areas needing improvement?	I am looking forward to seeing more of M's work with planning, implementation of programs and writing. Thus far, there has been limited opportunity for her in these areas but I am confident that she will grow, including honing her planning skills and adapting her writing skills for the municipal government environment.
Other comments regarding the intern:	As M may have informed you, she has applied for and been offered a full-time grant funded position here at the Health Dept. She has been a pleasure to work with thus far and I'm excited about her addition to our team.

Future Opportunities

Would you be willing to take another student next semester?	Yes

Compiling health data/statistics	Good
Facilitating group process	N/A

E) Personal Characteristics

Dependability	Fair
Tactfulness	N/A
Listening ability	N/A
Sensitivity	N/A

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Fair
What are the outstanding strengths of the intern?	Once we were able to create a schedule that worked for S, his attendance was good.
What are the areas needing improvement?	I would like to have seen more initiative from S. He encountered roadblocks in the task that he was performing, but he didn't bring these issues to my attention. It was only after I noticed that there was a trend in his daily reports and brought it up to him that we were able to discuss the issues he was facing and work on some solutions. I would like to have seen the initiative come from him to raise the issues and solve the problems.
Other comments regarding the intern:	S seems to get impatient when his expressed wishes are not complied with immediately, both by me and by the departmental support staff.

Future Opportunities

Would you be willing to take another student next semester?	Yes

EVALUATION FORM - SUPERVISOR

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Very good
What are the outstanding strengths of the intern?	R is reliable and organized. R gets along well with all teammates, support staff, and patients, and completes her tasks in the expected time frames. R worked diligently to maintain our missing Versus badges, and assisted in follow-up with both staff and patients to ensure our workflow was maintained. Additionally, R educated other staff members on how to utilize the technology, and demonstrated drive and a willingness to learn.
What are the areas needing improvement?	R did a wonderful job excelling at the tasks given/suggested at the beginning of the internship, but I encourage her to continue to be innovative, and think of process improvements that may better improve our workflow and project work.
Other comments regarding the intern:	R did a wonderful job!

B. Overall Feedback on Internship:

1. Was the internship was useful for your agency? Are there any suggestions you would like to make for the internship program?

Yes, K was a wonderful addition to the research project. He brought both enthusiasm and drive. He was committed and inquisitive. He will make a wonderful clinician/leader in the future.

2. Would you like to continue participating in the Lehman MPH internship program?

☐ Yes X No ☐ Not sure

-Both of the preceptors are leaving the institution.

B. Overall Feedback on Internship:

1. Was the internship was useful for your agency? Are there any suggestions you would like to make for the internship program?

Yes, this experience has been a tremendous benefit to the clinic and the patients we care for. Overall the testing phase showed that patients were receptive to the screening process. We identified a few challenges with regards to staffing issues that require further assessment before screening can be fully implemented. We would not be at this stage without K's hard work on this project the last few months.

2. Would you like to continue participating in the Lehman MPH internship program?
   ☐ Yes ☒ No ☐ Not sure
   I have recently transitioned to a new role and unfortunately will not have the capacity to precept a student in the future.

B. Overall Feedback on Internship:

1. Was the internship was useful for your agency? Are there any suggestions you would like to make for the internship program?

   A's work is very helpful and has already resulted in the revision in our food pantry intake forms so we may capture more data about the connection between housing instability and food insecurity. Her work also helped us think through how to create a new Eviction Prevention Plan that contains all the necessary elements to help low-income individuals living with HIV/AIDS and other chronic illnesses to achieve improved housing and health outcomes.

   One of the concerns I have, as I mentioned a couple of months ago, is that A's writing skills are average at best. She needed significant help in structuring her final paper, create content

that was logical, user friendly and impactful. After much discussion with her, she is taking a writing class this summer.

As a former Capstone professor at the NYU Wagner School for 10 years, I am very aware of and concerned about how little attention is paid, even at the graduate level, to student writing skills. Professors must be encouraged or incentivized to deal with this issue rather than ignoring it as many high school teachers clearly did. Poor writing skills will halt a career before it starts. If as educators we are committed to CUNY students' success, they must take responsibility for helping their students identify and improve those skills that if not addressed will hold students back.

At the very least, professors should be required to refer students to the writing tutoring center and Lehman must extend the tutoring center hours to accommodate evening and night students. I imagine there are other measures as well. Ignoring these deficits not only harms the student's prospect for a career but also reflects poorly on CUNY.

2. Would you like to continue participating in the Lehman MPH internship program?
   X☐ Yes ☐ No ☐ Not sure

B. Overall Feedback on Internship:

1. Was the internship useful for your agency?

   As a direct result of the focus groups and the feedback back provided, the Jack Aron Program staff has implemented (3) new groups for the target population. The groups are as follows:

   - Co-occurring Mental Health and Substance Abuse Treatment Group
   - A Psycho Educational Group
   - Sex Addiction Treatment Group

   The Sex addiction curriculum will be the first one implemented for utilization at the Phoenix House Foundation. In addition, the New Evidence Based Practice (EBP) curriculums were researched and identified to support generalist practice for the specialize population. The new EBP curriculums are Building Social Support, Managing Emotions, and a Treatment Curriculum called Sex Addiction Module. Prior screening tools utilized by the agency failed to identify appropriate clients for services, which in return created barriers in the learning environment. The new screening tool developed by the team appeared to be more comprehensive when identifying appropriate clients for program services.

   In summary, the program staff learned that the young adults appeared to be in unhealthy relationships with their significant others, had poor decision making skills, they also utilize marijuana and alcohol frequently within the last six months with a few on psycho tropic medications for depression. Lastly, due to the provided information, an Outreach Worker's position will be created within the next 45 days to conduct case management, case advocacy and make referrals to appropriate treatment providers for mental health services. Substance Abuse treatment services will continue to be on site. The information provided from the focus groups was informative and necessary for overall program development.

2. Are there any suggestions you would like to make for the internship program? Not at this time.

3. Would you like to continue participating in the Lehman MPH internship program? Yes

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Pamela D.	Sup Last Name:	Straker, Ph.D.
Organization:	Brooklyn Health Disparities Center, Inc		

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Excellent
Uses time effectively	Excellent
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Excellent
Effectiveness in oral communication	Excellent
Ability to identify problems and proposes solutions	Excellent
Overall quality or work produced	Excellent

B) Work Attitudes

Accepts responsibilities	Excellent
Takes initiative	Excellent
Follows policies, rules, regulations, etc.	Excellent
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Excellent

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Excellent
Supervisor	Excellent
Personnel from other organizations	Excellent
Clientele	Excellent
General public	Excellent

D) Application of community Health Skills

Assessing health problems	N/A
Developing health objectives	N/A
Planning health programs/projects	Excellent
Implementing programs/projects	N/A
Evaluating programs/projects	N/A
Developing budgets	N/A
Applying research methodologies	N/A
Compiling health data/statistics	N/A
Facilitating group process	N/A

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	L has a keen interest in health disparities and an aptitude for understanding the complexity of the issues associated with and played a significant role in forwarding the goals of BHDC in the short time she has been with us. She is able to take on projects, work them through and offer solutions for challenges encountered. With her assistance we held our 2014 Spring Conference, enhanced our website, and clarified our social media connections so important to our ability to communicate effectively. She is working on a research paper that we hope may be featured on our web site.
What are the areas needing improvement?	None Noted
Other comments regarding the intern:	We need more like L!

Future Opportunities

Would you be willing to take another student next semester?	Yes

B. Overall Feedback on Internship:

1. Was the internship was useful for your agency? Are there any suggestions you would like to make for the internship program?
   The internship Y was involved with was very useful for my organization. We recently opened, about a year ago, and want to gain the trust of the community. This community has a lot to improve with regard to health, and our goal is to educate patients not just treat them. Y was instrumental in helping us to educate ourselves, and getting the message across the community.

2. Would you like to continue participating in the Lehman MPH internship program?
   ☒ Yes ☐ No ☐ Not sure

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Dave	Sup Last Name:	Bryan

Organization:	Brooklyn College Health Programs Immunization Requirements Office

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Excellent
Uses time effectively	Very good
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Very good
Effectiveness in oral communication	Very good
Ability to identify problems and proposes solutions	Excellent
Overall quality or work produced	Excellent

B) Work Attitudes

Accepts responsibilities	Excellent
Takes initiative	Excellent
Follows policies, rules, regulations, etc.	Excellent
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Very good

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Excellent
Supervisor	Excellent
Personnel from other organizations	N/A
Clientele	Very good
General public	N/A

D) Application of community Health Skills

Assessing health problems	N/A
Developing health objectives	N/A
Planning health programs/projects	N/A
Implementing programs/projects	Excellent
Evaluating programs/projects	Excellent
Developing budgets	N/A
Applying research methodologies	N/A
Compiling health data/statistics	Very good
Facilitating group process	Very good

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	Mr. W was very enthusiastic about the internship and driven to share his acquired knowledge on health education. He arrived to work on time and ready to learn and contribute to the process. He displayed initiative by sharing ideas on how we can increase the number of students at events. He immediately focussed on sharing event information with both faculty and students in the Health and Nutrition Science department and with students that utilized the Library Cafe'.
What are the areas needing improvement?	Mr. W needs to focus on becoming proficient in social media devices as a means to communicate to the young adult population.
Other comments regarding the intern:	It was a pleasure working with Mr. W. I am sure he will bring his energy and enthusiasm to improving the health education network in the community.

Future Opportunities

Would you be willing to take another student next semester?	Yes

B. Overall Feedback on Internship:

1. Was the internship was useful for your agency? Are there any suggestions you would like to make for the internship program?

This internship was extremely useful for me and my agency. [redacted] was an great addition to our team.

2. Would you like to continue participating in the Lehman MPH internship program?
   ☐ Yes ☐ No ☒ Not sure

Return to: Emma Tsui (emma.tsui@lehman.cuny.edu)

INTERNSHIP REFLECTION PAPER

I. Overview

The Diabetes Research Center (DRC) at the Albert Einstein College of Medicine delivers strong academic and research program that serves as a training atmosphere for creative basic and translational research linked to the causes and treatment of diabetes and its complications. The DRC is equipped with a collaborative forward-looking infrastructure that includes several components and multiple tools to facilitate diabetes prevention and control. The DRC supports an avant-garde relationship amid research, training, clinical and community-based activities. The DRC is major National Institutes of Health (NIH)-funded project that encompasses different components, which are: the Administrative Core, Animal Physiology Core, Metabolomics Core, Human Islet Core, Analytical Research Core, Translational Research Core, and a Prevention and Control Core. The Einstein DRC Prevention and Control (P&C) Core provides the necessary linkages from basic science, epidemiology, and translational research in order to aid, treat and prevent patients from complications relating to diabetes. The P&C Core provides support across a broad range of research and community projects for primary, secondary and tertiary prevention in diabetes and related conditions. Through three distinct functional units, it provides the focal point for addressing health disparities among minority populations and underserved communities. [Figure 1]

My preceptor, Dr. Rajat Singh is a distinguished faculty member at the Albert Einstein College of Medicine. Dr. Singh's research interest is in understanding roles for hypothalamic neuron-specific autophagy in the regulation of overall energy balance, in particular, how changes in neuronal autophagy contribute to the development of the metabolic syndrome of aging. Dr. Singh has 8 years of experienced work on cellular mechanisms contributing to the manifestations

of metabolic syndrome, and 5 years of experience in studying autophagy. Recent work from his laboratory has revealed that autophagy in hypothalamic agouti-related peptide (AgRP) neurons links neuronal lipid metabolism to orexigenic AgRP expression (Kaushik et al, 2011), and that AgRP neuron-specific loss of autophagy decreases food intake and promotes a lean phenotype. As a mentor in his current grant, Dr. Singh has focused his efforts in the following areas: 1) determining whether nutrient, and hormonal activation of Macroautophagy in POMC neurons is mechanistically linked to peripheral energy expenditure; and 2) to examining whether restoration of hypothalamic MA using a novel scheduled-feeding intervention reverses or prevents the development of the metabolomics syndrome of aging. Dr. Singh's laboratory has standardized procedures to characterize autophagy in hypothalamic neurons, and his background in physiology and cell biology makes him well suited to serve as my preceptor in my internship. My role in this project was to investigate the connection that the Einstein Diabetes Research Center has with research conducted in Dr. Singh's lab, as well as analyze this link, mainly in relation to the Prevention and Control Core. The ultimate goal of the DRC is find innovation, through research, that can develop new therapies for the prevention and treatment of diabetes.

Montefiore Medical Center (MMC) is Einstein's primary affiliated academic health center. The Clinical Diabetes Center at Montefiore provides a wide-range care for adults with diabetes. My internship site consisted of several healthcare locations within the MMC community, which were:

Montefiore Hospital
111 East 210th Street
Bronx, NY 10467
Phone: 718-920-4321

Weiler Hospital

1825 Eastchester Road
Bronx, NY 10461
Phone: 718-904-2000

Wakefield Hospital
600 East 233rd Street
Bronx, NY 10466
Phone: 718-920-9000

The Clinical Diabetes Center at Montefiore Medical Center is a center that was created from the collaboration with the DRC at the Albert Einstein College of Medicine. Montefiore and its affiliates are committed to serving their immediate community, which includes a large Hispanic population. The clinic serves adults age 18 and older who are referred by their primary care physician for education and self-management of complications that stem from the endocrine system. The clinic provides diabetes education which includes nutrition counseling, insulin pump training and subcutaneous glucose monitoring. The goal is to teach and empower patients to improve their health through better management of diet and prescribed medications.

II. Reflecting on the process of conducting your internship project

The Clinical Diabetes Center at Montefiore has been an instrumental institution for recruitment in several landmark studies including the Diabetes Control and Complications Trial, the Diabetes Prevention Program Outcomes Study (DPPOS), the Epidemiology of Diabetes Interventions and Complications (EDIC) study, the Preventing Early Renal Loss (PERL) in Diabetes study, and the Glycemia Reduction Approaches in Diabetes: A Comparative Effectiveness (GRADE) study. The study that I mainly participated in was the GRADE study. A brief description of the GRADE study is the involvement of 5,000 patients to be randomly assigned to take one of four medications that lower blood glucose. In addition to the randomly assigned medication, each of the 150+ individuals taking part at the Einstein-Montefiore trial site

will receive nutritional advice and education in diabetes control and prevention. My duties as a research administrator during my internship was to recruit subjects, coordinate screening and study visits, manage study compliance with IRB regulations, obtain informed consent and HIPAA authorization, administer research questionnaires and psychological tests, complete the necessary records and data entry and study related measurements and other administrative tasks such as coordinate DRC workshops and conferences.

When I am not at the clinical recruitment sites, I spend a great deal of time in the lab. Dr. Singh research deals primarily in the basic sciences and uses animals as test subjects. Dr. Singh research suggests that the metabolic syndrome is characterized by obesity, hypertension, hyperlipidemia, and glucose intolerance. I worked along-side the associates in the lab to operate centrifuges, maintain laboratory equipment, arrange specimens for examinations, and keep lab in sanitary conditions and in accordance to safety procedures. The members of my team of associates and technicians that I worked with were Nuria Martinez-Lopez, Srabani Sahu and Diana Athonvarangkul. During the initial weeks of my internship I often struggled to find my way around this new environment in which I did not have any prior experience with. I had difficulties understanding the terminologies that were often spoken among the members in the lab. Looking back, there are many things that I would have done differently had I began my internship project today. I truly believe that the stress of maintaining my employment, attending classes, and participating in m internship began to collide with one another. My schedule was dense and my patience was slim. I felt as though I was working two jobs and going to school. Patient recruitment was not an easy task as well. I had to maintain a professional demeanor while dealing with the different personalities that walked into the clinic. My preceptor mentored and guided me through this process of taking steps that would enabled me to engage myself in a

more productive way with his team in the lab and the clinic. Dr. Singh often spoke to me at meetings and mentioned how disconnected I appeared to be. He reassured me that it perfectly fine if I did not understand some of the concepts in this field of science and everyone started their careers not knowing much of what they do. The discussions I had with Dr. Singh about my presence in his project humbled me. I was delighted to understand that I would be measured on my efforts in how I adapted to the work and not entirely on whether or not I completed the work. Four months is a very short time to accomplish measurable data to complete a research that is budgeted for five years. In addition to my duties in at the clinic and in the lab, I supervised the purchasing, receiving, storing, and distribution of laboratory equipment used by the members in his project.

III. Reflecting on the content and implications of your internship project

The primary mission of the Einstein DRC P&C core is to promote high-quality diabetes translational research, through the delivery of services that consist of consultation, training and mentoring in clinical research methods that are specifically applicable to diabetes, its complications and related metabolic defects. These services derive from the broad expertise of investigators with distinct backgrounds, encompassing studies in clinical physiology, clinical trials involving diabetes, and obesity and patient-centered outcomes research; thus spanning the spectrum of translational research. The Einstein DRC provides cost effective, considerable design and implementation of human-based clinical and population based studies to improve our understanding and treatment of patients with diabetes.

Dr. Singh's research project employs sophisticated research methodologies to assist Einstein DRC investigators in the *in vivo* assessment of glucose and fatty acid metabolism,

insulin sensitivity and energy homeostasis in rodents. Through collaborative efforts, both Singh's lab and the P&C core can thoroughly characterize the effects of defined pharmacological, dietary, environmental and genetic alterations on glucose and lipid homeostasis, insulin action, and metabolism.

The importance of this project is the Einstein-Montefiore Diabetes Research Center (Einstein/Montefiore-DRC) continues to contribute to the discovery, application and translation of scientific knowledge for the treatment and cure of diabetes. Einstein/Montefiore-DRC serves as a nexus which enhance diabetes research, education and training; and promotes scientific findings from the bench to the bedside, and ultimately the community, especially in underserved and minority populations.

To accomplish these goals, I have recognized that it begins with small collaborative research and studies fostered by innovative investigators attempting to discover new ways to treat illnesses. The results from this project will help us modify treatment and improve blood glucose levels and circumvent some of the more preventable complications that can severely affect patients' lives. This internship was a great example for me as student to participate in. I was given the opportunity to see how my role impacts the overall goal of the project because I sincerely felt that my contributions were essential, however minor it may have appeared to be, to the grand project. My participation this semester was a great public health practice because my duties in the internship played a role in research that develops new therapies for prevention and treatment of diabetes.

IV. Overall Reflection

The goals that I set at the beginning of the semester on the logic model were to: 1) improve my ability to integrate public health theory with community based training, 2) improve my communication and professional skills attained from on-site training, and 3) improve my leadership skills and responsibilities for planning and administration of lab activities. The community based care that Montefiore Medical Center provides ensures that local residents, including the two million people that reside in the Bronx, have access to quality health care. Montefiore Medical Group have more than 20 local community sites that actively educates there patients about issues that promotes healthier lifestyles. MMC is a major site for NIH funded research in clinical trials and an excellent training atmosphere for theories in community based training, and for improving my communications and leadership skills. Therefore, I definitely achieved the goals that I outlined for myself on my logic model.

Diabetes, its complications, and related endocrine diseases are a major focus of public health concern at the local, national and global levels. The success of Einstein's research programs derives in large part from synergistic interdisciplinary collaborations. I received the most satisfaction out my experience in my internship because I was able to witness and contribute to this form collaboration. From my involvement in the Diabetes Center Conferences to the administration of lab supplies, I was able to play an instrumental part in research and how innovation is created.

I am approaching the very end of my journey as a student in the CUNY School of Public Health at Lehman College and my take-away from my experiences during these years and during my internship, is that the health of my community is essential and directly linked to my own. I am more passionate about the policies that contribute to the well-being of my community.

Therefore, I vow to be an active participant from this point forward in the issues that relates to the science and policies of the public health community.

STUDENT EVALUATION OF INTERNSHIP EXPERIENCE FORM

Please provide an honest assessment of your internship experience. Your responses will not be shared with anyone from the internship site.

1. **Student's name:** [redacted]
2. **Title of internship project:** Autophagy and Metabolomic Regulation in Aging
3. **Date of this form:** 06/06/2014
4. **Internship start & completion dates:** February 18, 2014 to June 6, 2014
5. **Preceptor's name & title:** Rajat Singh, MD/Assistant Professor of Medicine and Molecular Pharmacology
6. **Agency name and borough:** Albert Einstein College of Medicine/Bronx
7. **Total number of hours completed:** 180 hours
8. **Describe the primary duties for which you were responsible:** My role as an intern in Dr. Singh's lab was to provide essential data from the clinical trials core to support Singh's theory and research. My responsibility was to recruit patients into the clinical physiology research trials in diabetes and metabolism at the Diabetes Research Center. I collected records, review and summarized data from the Prevention and Control core to supplement to support Dr. Singh's research in the Animal Physiology core.
9. **How prepared do you think you are in the following areas as a result of your internship? (Insert an X in the appropriate box for each competency)**

Competency	Very well prepared	Well prepared	Adequately Prepared	Inadequately prepared	Not prepared	Not applicable to my project
Obtaining & using appropriate information from published and unpublished literature	X					
Assessing health problems	X					
Developing health objectives	X					
Using health-related data	X					

Competency	Very well prepared	Well prepared	Adequately Prepared	Inadequately prepared	Not prepared	Not applicable to my project
Planning & developing health programs and projects	X					
Managing health programs	X					
Evaluating health programs	X					
Developing surveys, questionnaires, etc.	X					
Collecting data	X					
Analyzing data	X					
Obtaining relevant information from the Internet	X					
Working collaboratively on a team	X					
Working collaboratively with community representatives & organizations	X					
Conducting meetings	X					
Financial planning & management skills	X					
Leadership skills	X					
Other *(please specify)*						

10. Overall, how would you rate your internship experience?

☒ Excellent ☐ Very good ☐ Good ☐ Fair ☐ Poor

11. Rate the level of guidance/mentoring you feel you received from your preceptor:

☒ Excellent ☐ Very good ☐ Good ☐ Fair ☐ Poor

12. Would you consider working for this agency after you graduate?

☒ Yes ☐ No ☐ Not sure

13. Would you recommend this placement for other students? Why or why not?

I would absolutely recommend this placement for another student because I was able to earn a great deal of experience from the Montefiore Clinic sights.

14. Please provide a brief summary of the most important things you learned from your internship:

Diabetes, its complications, and related endocrine diseases are a major focus of public health concern at the local, national and global levels. The success of Einstein's research programs derives in large part from synergistic interdisciplinary collaborations. I received the most satisfaction out my experience in my internship because I was able to witness and contribute to this form collaboration. From my involvement in the Diabetes Center Conferences to the administration of lab supplies, I was able to play an instrumental part in research and how innovation is created.

15. Please provide any additional comments or suggestions that would help the MPH program improve the internship experience:

What is the GRADE study?

The goal of the GRADE study is to try to determine which combination of diabetes medications best controls blood sugar levels, has the few side effects and benefits overall health.

Why should I participate?

Many of us have family and friends who have diabetes. By participating in this study, you would be helping us to help others by improving how diabetes is treated.

Can I be included in this study?

You may be eligible, if you are:

- An adult with diabetes for less than 10 years
- Only taking metformin for your diabetes
- Are willing to take a second diabetes medication if needed.
- Speak and read in English or Spanish

What are the benefits?

Participants will receive:

- Diabetes medications and supplies provided at no cost
- Diabetes care visits and lab test at no cost
- Annual diabetes education at no cost
- Help to better control blood sugar levels.

What do I have to do?

- You will have 4 visits per year with the GRADE study team.
- You will be in the study for up to 7 years.
- You will continue to take the diabetes medicines that GRADE provides to you, while you are in the study.

The study visits will take place at Montefiore/Einstein Clinical Research Center.

Recruitment Updates and Summarization:

Over the past 4 months (since February 2014), we have been actively recruiting and studying subjects. Table 1 details recruitment data from February, 2014 to June, 2014 for this arm of the protocol. Nine subjects have been enrolled in the first arm of this protocol thus far, and have completed at least 1 hypoglycemic study.

Completed phone screenings	Phone screenings eligible for clinical visit	Subjects who completed clinical screening visit	Eligible subjects after clinical screening	Percentage of clinically eligible subjects who are enrolled
38	30	25	17	52.9%

TABLE 1.

Summary of Results:

While intensive glycemic control improves outcomes in type 1 diabetes mellitus (T1DM), hypoglycemia limits its attainment. Indeed, insulin therapy for T1DM that attempts at tight glycemic control often results in recurrent hypoglycemia. Such recurrent hypoglycemic episodes ultimately cause blunted counter-regulatory responses, culminating in hypoglycemia-associated autonomic failure (HAAF), defined by impaired counter-regulatory hormone responses to hypoglycemia and hypoglycemia unawareness, with potentially detrimental clinical outcomes.

Of note, hypoglycemia counter-regulation is associated with release of endogenous opioids, and therefore progressive tolerance to these factors may cause HAAF. Physiologic stressors known to induce the release of endogenous opioids, including exercise, have been shown to blunt counter-regulatory responses during subsequent hypoglycemia, thereby contributing to the pathogenesis of HAAF (*JCEM* 97: 623-631, 2012). Importantly, the onset of HAAF can be *prevented* in non-diabetic subjects by opioid receptor blockade with naloxone during antecedent hypoglycemia (*JCEM* 94: 3372-3380, 2009). Additionally, HAAF can be ameliorated in T1DM by administration of naloxone during antecedent hypoglycemia. Together, this supports the hypothesis that the endogenous opiate system contributes importantly to the development of HAAF in patients with T1DM (*Diabetes* 59: Supplement, 2010).

In order to examine the impact of opioid receptor activation on both biochemical and clinical responses to hypoglycemia, we examined counter-regulatory responses to hypoglycemia following morphine infusion in non-diabetic subjects.

Seven healthy subjects (4 males, age 33.4 ± 3.5 yr, BMI 23.9 ± 1.2 kg/m2) participated in two study protocols in random order over two consecutive days. On Day 1, subjects underwent two 120-minute infusions of either saline or morphine (0.1μg/kg/min), separated by a 120-minute break (with euglycemic nonclamped conditions throughout). On day 2, subjects underwent stepped hypoglycemic clamp studies (glucose nadir of ~60mg/dL) with evaluation of counter-regulatory hormone responses as well as endogenous glucose production (EGP, using 6,6-D2-glucose), and hypoglycemic symptoms (based on a standardized score). Plasma glucose target levels were attained in all subjects and were similar between study conditions (**Figure 1**).

Compared with saline infusion studies, infusion of morphine induced a blunted epinephrine response to hypoglycemia (**Figure 2**: saline= 554 ± 16 vs. morphine= 287 ± 37 pg/mL, p=0.006). This was associated with a 17.4% lower rate of EGP (p=0.03), as well as fewer hypoglycemia-associated headaches (p=0.02). Thus, antecedent morphine infusion significantly impacted counter-regulatory responses to hypoglycemia in healthy, non-diabetic subjects.

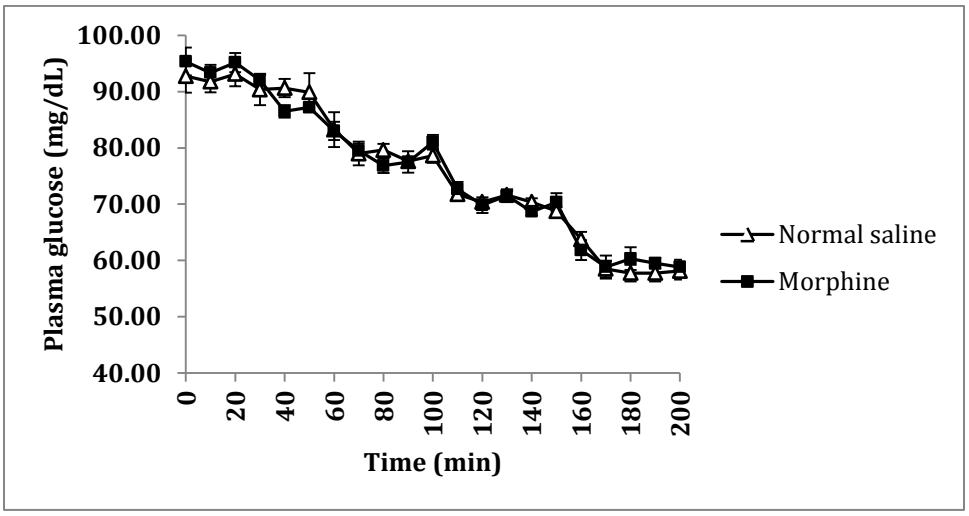

Figure 1. Plasma glucose levels at each successive glucose step during hypoglycemic clamp.

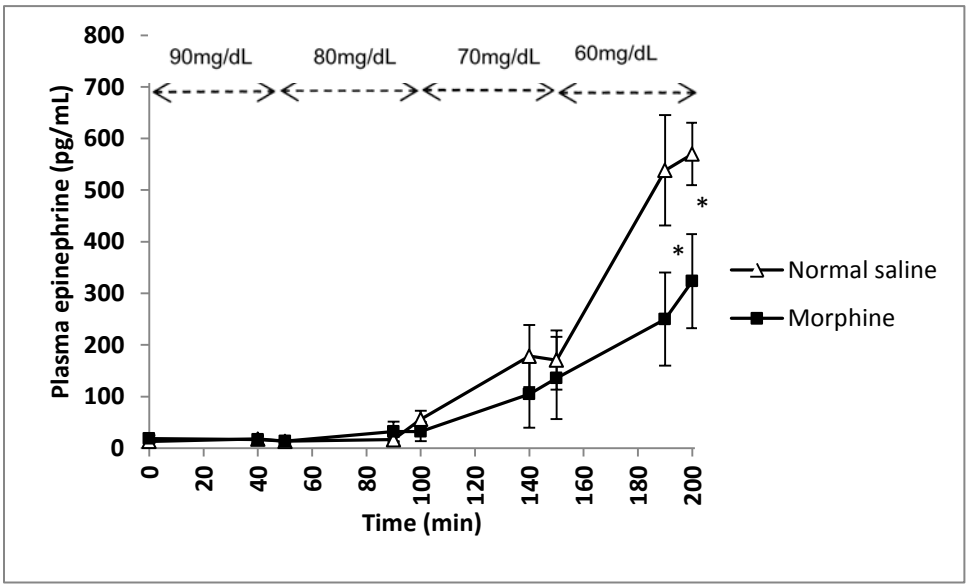

Figure 2. Plasma epinephrine levels at each successive glucose step during hypoglycemic clamp.

Significance:

These findings demonstrate that opioid receptor activation induces hypoglycemia-associated autonomic failure. Thus, opioid receptor blockade may represent an important tool for preventing HAAF, thereby suggesting novel pharmacologic approaches for safer intensive glycemic control in T1DM.

SIRT1 is an NAD^+-dependent deacetylase that has been found to be important in several metabolic processes including the regulation of glucose homeostasis, adipogenesis and mitochondrial function and lifespan extension. Our ongoing studies have primarily focused on the role of hypothalamic SIRT1 in the regulation of glucose homeostasis in an aging rodent model. We have also embarked on further investigation of the role of endogenous SIRT1 regulators in metabolism.

RESULTS

Basic Metabolic Profiling of F1 hybrid Fischer 344 X Brown Norway Rats

For these studies we elected to use the F1 hybrid Fischer 344 x Brown Norway (F344BN) male rats. These rats are known for their exceptional longevity while also exhibiting some of the same phonotypic features seen in human aging such as increased adiposity and insulin resistance. We examined animals across three age groups: 3 month (3M) young; 10 month (10M) middle-aged and 20 month (20M) old. To gain a better understanding of this rat model.

Table 1: Characterization of Basic Metabolic Profile of the F1

Insulin (ng/ml)	1.29±0.17	2.53±0.22*	
FFA (mEq/L)	1.20±0.13	1.43±0.26	
Adiponectin	4.91±0.23	NA	2.91*±0.55* (ng/ml)

Of note the fat mass increased significantly with age from ~10% in the young to 26% in the old. We observed a progressive increase in fasting plasma glucose and insulin levels. The free-fatty acid levels also increased slightly. Analysis of common adipokines showed a significant decline in adiponectin levels as illustrated in Table 1. Thus these studies confirm that the F344BN rats become insulin resistant as they age.

3M, 10M and 20M received acute MBH administration of either vehicle (5% DMSO), RSV (200 μM) or the SIRT1 selective agonist SRT1720 (100 μM) during pancreatic clamp studies. In the 3M old rats, treatment with MBH resveratrol and SRT1720 resulted in an ~3-fold increase in the glucose infusion rate (GIR) to maintain euglycemia (DMSO: 2.51 ± 0.48 *vs.* RSV: 7.77±0.39). This was primarily due to a decrease in the hepatic glucose production (DMSO: 7.49 ± 0.64 *vs*.

RSV: 5.96 ± 0.40 *vs*. SRT1720: 5.50 ±0.81) and an increase in glucose uptake (DMSO: 10.29 ± 0.63 vs. RSV: 12.78 ± 0.86 *vs*. 12.3± 0.67) Figure 2. In the 10M old rats, acute MBH resveratrol did not significantly change the glucose infusion rate, hepatic glucose production or glucose uptake. As such in this age group, resveratrol did not confer enhanced insulin sensitivity. However, direct MBH treatment with SRT1720 resulted in a 2-fold increase in the glucose infusion rate (DMSO: 1.99 ± 0.51 *vs*. SRT1720: 4.23 ± 1.005). The increase in GIR was due to increased glucose uptake in muscle (DMSO: 8.49 ± 0.59 *vs*. SRT1720: 11.81 ± 0.31).

There was no significant difference in hepatic glucose production in the treatment group. Similarly in the 20M old rats resveratrol treatment did not alter the GIR, hepatic glucose production or glucose uptake. However, treatment with SRT1720 increased the GIR by 2-fold. The glucose production was not significantly changed (DMSO: 6.09 ± 0.273 *vs*. 5.92 ± 0.50) while the glucose uptake was mildly increased (DMSO: 7.31 ± 0.576 *vs*. 8.64 0.51) as shown in Figure 2. These studies indicate a significant difference in how MBH administration of the known SIRT1 agonists affect whole body insulin production. Resveratrol is effective in the young but loses its effect in the middle-aged and old. SRT1720 is a highly effective insulin sensitizer in the young and maintains some degree of sensitivity even in the old.

Similarly basic metabolic studies failed to show any improvement in glucose handling or insulin sensitivity as would have been expected. Thus we conclude that the SIRT1-lentivirus as designed is not effective to yield SIRT1 overexpression in vivo. We are in the process of designing a new virus with a new construct that we hope will yield better results.

SUMMARY

These studies was carried out to determine if hypothalamic SIRT1 function decreases with age and to ascertain whether this decrease in SIRT1 function may contribute to the insulin resistance that is observed in aging rodent models. We have shown that F344BN rats show marked adiposity and insulin resistance that is evident as early as 10M and that is sustained until old age. Further these studies have revealed that hypothalamic SIRT1 expression and transcription decreases with age. SIRT1 has been shown to decrease under conditions of nutrient excess or insulin resistance and since the MBH is particularly sensitive to nutrient availability or hyper-insulinemia, it is not surprising that SIRT1 expression could be affected under these conditions. The ability of MBH resveratrol to affect insulin sensitivity is significantly impaired in the middle-aged and old animals compared to the young. Acute MBH treatment with SRT1720 was able to enhance insulin action in the middle-aged and old animals primarily by stimulating glucose uptake though this effect was significantly less than what was observed in the young. These studies bring to fore-front the concept that SIRT1 declines with aging and its association with insulin resistance, one of the primary manifestations of the aging process.

Budget Justification

The request of $248,400 is for the purchase of equipment in the first year. This equipment is also focused onto our increased utilization of rodent models to understand the dynamic and integrative physiology of diabetes and disordered metabolism. This equipment will be incorporated into the Animal Physiology Core infrastructure but the request and justification (below) is listed in the Administrative Core budget as per our sponsored programs office.

Currently, The ES-DRC supports 32 Oxymax/CLAMS indirect calorimetry chambers and a single environmental chamber that holds 8 of these Oxymax/CLAMS chambers. Since establishment of the regional ES-DRC these units have been heavily used with a 2-3 month scheduling back-up. In addition, there has been tremendous demand by investigators wishing to perform indirect calorimetry at non-ambient temperatures. Due to the large and continuous increased demand for mouse calorimetry, we are requesting $165,000 for the purchase of an additional Columbus Instruments 8 cage unit Oxymax/CLAMS indirect calorimetry system for the determination of energy expenditure, respiratory exchange rate, activity and food intake. We are also requesting $35,000 for the purchase of a second 8 unit Columbus Instrument environmental chamber to house the Oxymax/CLAMS system in order to perform the indirect calorimetry at defined environmental temperatures.

The BASi instruments Culex® Automated Blood Sampler ($25,000) is specifically designed for the collection of urine, feces, bile from mice that is substantially more difficult than for rats and new bowl cage design over comes many of the previous limitations. Another advantage is that this unit can be used following surgeries (ie: ICV cannula and EU-clamp) such that blood sampling and other manipulations can be simultaneously performed while obtaining urine, feces and bile. This equipment is not available at either Einstein or Montefiore.

We are also requesting funds ($23,400) for the purchase of a VisualSonics mouse EchoCardiogram (MicroScan transducer $19,900 and Mouse Handling (ECG plate) Table ($3,500). This instrument will be used for determining cardiac function in various mouse models, which is particularly important, as cardiovascular risk is the single largest complication for diabetic therapy. Currently, there is no available mouse EchoCardiogram available for ES-DRC investigator use at either Einstein or Mount Sinai.

Supplies:

We are requesting $20,000 for the purchase of paper products, radioisotopes, filters, syringes, needles, plasticware, solvents, buffers, chemical reagents, and calibration solutions required for clamps studies. In addition, these funds will be used for animal purchase and maintenance for a small number of rats and mice required for technique development and quality control of vascular catheters and highly specific parenchymal brain cannulation placement. Although the actual supply costs are significantly higher than those requested, recharge (charge back) fees will be used to recover the additional costs.

We are requesting $200,000 for the support of Pilot & Feasibility grants. These funds will be supplemented with $75,000 ($50,000 Einstein and $25,000 Montefiore) dedicated funds for a total of $275,000 to support an annual steady-state of 7 P&F awards at $39,000 each per year. In addition, institutional resources of up to $10,000/year in each ES-DRC Core will also be made available to all P&F awardees.

Microgrants:

Although administered through the P&F program, we are NOT requesting any NIH funds for microgrant awardees. These funds are provided through separate institutional resources provided to the ES-DRC that are non-overlapping with the institutional support for the P&F program.

Catalytic Seed Grant:

Similar to the microgrant program, we are NOT requesting any NIH funds for the catalytic seed grant awardees. These funds are provided through separate CTSA and institutional resources that are distinct from both the P&F and microgrant programs. This program is supported through the Einstein Institute for Clinical and Translational Research (Einstein CTSA) and ES-DRC members are frequent recipients of this funding (i.e. recent awardees include Drs. Crandall, Rastogi and Zang).

SUBJECT: Completion of Collaborative IRB Training Initiative (CITI) Program

This is to confirm that your Collaborative IRB Training Initiative (CITI) Program completion status has been recertified through **April 2, 2018.** CITI is required by AECOM as part of your 'Protection of Human Subjects in Research' education. This web-based program is multi-modular and includes information on the history, regulations, policies, procedures, and ethical principles that pertain to research involving human subjects.

Please retain this letter of certification for your records. It will be required for inclusion in NIH grant applications, and as other regulations are promulgated, may be required by other agencies, as well.

Thank you for your participation in this educational program.

HUNTER-BELLEVUE SCHOOL OF NURSING

PRECEPTOR EVALUATION OF STUDENT PERFORMANCE
COMMUNITY/PUBLIC HEALTH NURSING

Course: Nursing 771 772/773 Date: 4/27/15

Semester: _Spring 2015

Name of Preceptor: ___Charulata J. Sabharwal

Agency/Organization: _NYC Department of Health and Mental Hygiene

Name of Student: [redacted]

Preceptor:
Please review this form with the student. It is the student's responsibility to submit the completed form to the Seminar Faculty who assigns a final grade and gives the completed form to the Course Faculty. Without this form, the student cannot pass the course.

Please rate the student's performance in each of the following areas on a scale of "1" to "10," with "1" representing the lowest levels of performance and "10" the highest.

		Rating (1 to 10)
1.	Professional appearance/manner/demeanor	7
2.	Motivation	7
3.	Self-directed resourcefulness	7
4.	Value of the contributions to the Agency	7
5.	Reliability/adherence to promised schedules	8
6.	Interpersonal skills	7
7.	Overall rating	7

Total number of Agency clinical hours completed: 142.5

Preceptor's comments on particular areas of student growth and performance:

Ms. [redacted] worked with me for a brief amount of time due as I will be leaving the NYC Department of Health and Mental Hygiene effective April 30, 2015. In this short time, we reviewed the operations of the agency, bureau, program, and unit during her first month with me. During our second month, Ms. [redacted] attended various lectures and seminars which she reported back to me what she had gained from those. In the final weeks, she had started working on a small project to modify critical presentations. Ms. [redacted] has great potential but must ensure that she is clear about the task at hand and would benefit from close supervision. Due to my impending departure, we did not have an further opportunities to work on any further projects. As always, it was a pleasure serving as her supervisor despite the short time period.

COMMENTS (Please respond briefly. Use reverse side if necessary)

1. Special strengths:

All of [redacted] work has been excellent technically and aesthetically. I have been extremely impressed with the accuracy, thoroughness, and overall quality of his work. He has shown great initiative, creativity, and general ability to get things done well.

2. Skills and knowledge needing further improvement:

[redacted] is working on getting to work on time and better organizing his time while here. This has improved, but still needs further work. He needs to work on prioritizing tasks and focusing on end goals.

3. Other comments:

I have really appreciated having [redacted] on the team this spring and look forward to continuing to work with him over the summer.

Preceptor's comments on particular areas of student growth and performance:

[redacted] has worked with us on several projects, including abstraction of overdose mortality files and a summary of reports from medical examiner's office. [redacted] did a great job with distilling the alcohol reports & translating findings into a power point. She did an excellent job presenting the findings to staff. The work is very valuable to our bureau & we look forward to her continuing in the fall.

Signature of Agency Preceptor — Date: 5/15/15

Student Comments: My first semester at the Department of Health has certainly been a great learning experience. I was given several opportunities to work on several projects the BAEPC bureau is involved in. Denise has been a great preceptor and her staff was supportive of my efforts.

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Dr. Adinah	Sup Last Name:	Pelman
Organization:	Union Plaza Care Center		

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Very good
Uses time effectively	Excellent
Reliably completes tasks on time	Very good
Effectiveness in written communication	Excellent
Effectiveness in oral communication	Excellent
Ability to identify problems and proposes solutions	Excellent
Overall quality or work produced	Very good

B) Work Attitudes

Accepts responsibilities	Very good
Takes initiative	Excellent
Follows policies, rules, regulations, etc.	Very good
Graciously accepts ideas and suggestions	Very good
Perfoms tasks with industry and drive	Excellent

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	Very good
Supervisor	Excellent
Personnel from other organizations	N/A
Clientele	N/A
General public	N/A

D) Application of community Health Skills

Assessing health problems	Very good
Developing health objectives	Very good
Planning health programs/projects	Excellent
Implementing programs/projects	Excellent
Evaluating programs/projects	Excellent
Developing budgets	N/A
Applying research methodologies	Good
Compiling health data/statistics	N/A
Facilitating group process	Very good

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Very good

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	Innate ability to understand and identify potential problems. Continuing attention to detail.
What are the areas needing improvement?	Could take more initiative on projects.
Other comments regarding the intern:	Overall excellent experience. Would recommend as an employee.

Future Opportunities

Would you be willing to take another student next semester?	No

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	K came to this internship with an interest in infectious vector-borne diseases. Her responsibilities consisted of putting together a plan for surveillance of mosquito habitat. Once we started, she worked with me to document the sites via GPS, working with N to find people to interview, and photographing the sites. She then compiled these materials for further analysis. K was a resilient in conditions that were hot, insect ridden, and lacking in amenities. Despite the discomfort, she was intellectually engaged in the project and she sought to learn more about not only mosquito borne illness but also community health education strategies in developing countries. She worked well with all members of the team--the Capracare volunteers, the nurses and other visitors. It was a truly collaborative effort working with her (and N) on this project. She excelled at being able to focus both on immediate details while keeping in mind the bigger picture.
What are the areas needing improvement?	I had hoped to get more of the geospatial analysis accomplished but it will take some additional effort to learn the mapping methods. I had hoped she'd take a bit more initiative but this comment is more about a missed opportunity than a criticism. We have discussed this and she's interested in continuing with the geospatial analysis over the summer.
Other comments regarding the intern:	K proved to be adaptable and skilled; always a pleasure to work with.

Future Opportunities

Would you be willing to take another student next semester?	Yes

5. Submits accurate, well documented work and reports	X				
6. Accepts responsibility and completes work assignments	X				
7. Raises innovative ideas and brings out creative and innovative ideas in others	X				

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. Special strengths: [redacted] **is a consummate team player, excels in systems thinking, brings a strong empathy for the community this project is serving, and has helped guide "many" decisions around the community report being developed. [redacted] is highly skilled and would be hired again in a heartbeat.**
2. Skills and knowledge needing further improvement: **Few areas in need of improvement. [redacted] has been a terrific asset in a complex environment (Partnerships like HHAP are inherently complicated, and [redacted] works for a preceptor who is pulled in many directions). [redacted] communicates well with all partners, including her preceptor. The only two suggestions for improvement are extremely modest in scope, and they include: (1) In writing initiatives, work from an outline approach and get input at each stage of writing, to avoid delving**

too far in certain directions unnecessarily; (2) Taking initiative to 'check in' more frequently when priorities and deadlines meant to maximize communication. On the latter item, the preceptor takes full responsibility for not always encouraging this herself.

3. Other comments: [redacted] has natural project management tendencies and excellent data management skills. She is passionate about advocating for disadvantaged communities in the context of a complex healthcare system and would be a true asset to any organization conducting research to address health disparities or improve quality of care. We will sorely miss [redacted] creativity and productivity on this project.

EVALUATION FORM - SUPERVISOR

Intern Information

Int First Name:		Int Last Name:	

Supervisor Information

Sup First Name:	Betsy	Sup Last Name:	Eastwood
Organization:	SUNY Downstate Medical Center		

Evaluation

Please evaluate the intern based on the following aspects

A) Work Performance

Arrives on time consistently	Excellent
Uses time effectively	Excellent
Reliably completes tasks on time	Excellent
Effectiveness in written communication	Excellent
Effectiveness in oral communication	Excellent
Ability to identify problems and proposes solutions	Excellent
Overall quality or work produced	Excellent

B) Work Attitudes

Accepts responsibilities	Excellent
Takes initiative	Excellent
Follows policies, rules, regulations, etc.	Excellent
Graciously accepts ideas and suggestions	Excellent
Perfoms tasks with industry and drive	Excellent

Evaluation

Please evaluate the intern based on the following aspects

C) Professional Relationship With:

Professional staff	Excellent
Support staff	N/A
Supervisor	Excellent
Personnel from other organizations	Excellent
Clientele	N/A
General public	N/A

D) Application of community Health Skills

Assessing health problems	N/A
Developing health objectives	N/A
Planning health programs/projects	Excellent
Implementing programs/projects	Excellent
Evaluating programs/projects	Excellent
Developing budgets	N/A
Applying research methodologies	Excellent
Compiling health data/statistics	Excellent
Facilitating group process	N/A

E) Personal Characteristics

Dependability	Excellent
Tactfulness	Excellent
Listening ability	Excellent
Sensitivity	Excellent

Evaluation

Please evaluate the intern based on the following aspects

F) Overall Assessment

What is the overall assessment of the intern?	Excellent
What are the outstanding strengths of the intern?	N is a very quick study. She grasps ideas and tasks really quickly. She has also pitched in when we have had surprise deadlines. She sticks with the job until it's done.
What are the areas needing improvement?	N still does not know how smart she is. When she figures this out, she'll fly.
Other comments regarding the intern:	best ever!

Future Opportunities

Would you be willing to take another student next semester?	Yes

HUNTER COLLEGE OF THE CITY OF UNIVERSITY OF NEW YORK
HUNTER-BELLEVUE SCHOOL OF NURSING

PRECEPTOR EVALUATION OF STUDENT PERFORMANCE
COMMUNITY/PUBLIC HEALTH NURSING

Course: Nursing 771/772/773 Date: 5/13/15

Semester: Spring Semester 2015

Name of Preceptor: Bianca Lopez

Agency/Organization: Boom! Health

Name of Student: [redacted]

Preceptor:
Please review this form with the student. It is the student's responsibility to submit the completed form to the Seminar Faculty who assigns a final grade and gives the completed form to the Course Faculty. Without this form, the student cannot pass the course.

Please rate the student's performance in each of the following areas on a scale of "1" to "10," with "1" representing the lowest levels of performance and "10" the highest.

		Rating (1 to 10)
1.	Professional appearance/manner/demeanor	8
2.	Motivation	8
3.	Self-directed resourcefulness	8
4.	Value of the contributions to the Agency	8
5.	Reliability/adherence to promised schedules	8
6.	Interpersonal skills	8
7.	Overall rating	8

Total number of Agency clinical hours completed: 166.5

Preceptor's comments on particular areas of student growth and performance:

[redacted] is very resourceful and completes tasks independently in a timely fashion - I look forward to continue working with her next semester.

Please rate the student's performance in each of the following areas on a scale of "1" to "10," with "1" representing the lowest levels of performance and "10" the highest.

		Rating (1 to 10)
1.	Professional appearance/manner/demeanor	9
2.	Motivation	8
3.	Self-directed resourcefulness	7
4.	Value of the contributions to the Agency	8
5.	Reliability/adherence to promised schedules	10
6.	Interpersonal skills	7
7.	Overall rating	8

Total number of Agency clinical hours completed: 171

Preceptor's comments on particular areas of student growth and performance:

[redacted] worked very well but needed a lot of direction and support - however, when given a task she worked very hard to complete and do her best. She was always punctual and gave account for her time and work produced. She was polite and always had a nice appearance. She was kind to the patients she interacted with.

* Areas for improvement → taking initiative
↳ interpersonal skills [*note- Even in the course of the semester, [redacted] improved considerably in this area - introducing herself, making eye contact, improved communication with myself and staff.]

Overall, despite taking more time and work on my end than anticipated, [redacted] contributions to the organization and the clinic were many and so very valuable. I am grateful for her time and support.

Preceptor's comments on particular areas of student growth and performance:

[redacted] came to our program with incredible enthusiasm to learn about the services we provide for HIV+ youth & high risk LGBT youth. She is a very quick learner, highly personable with patients & a great team member. She quickly became apropponent of the clinic's philosophy of harm reduction & youth focused approach to HIV treatment adherence. She will make an outstanding advanced practice public health nurse.

Preceptor's comments on particular areas of student growth and performance:

During this semester Ms. [redacted] has taken a leadership role as the interviewer for a qualitative study conducted collaboratively under the aegis of a parent study funded by AHRQ to develop interventions to reduce health care associated infections among staff and children in three pediatric longterm care facilities. A total of 29 interviews were conducted and the qualitative data are now being analyzed. Ms. [redacted] will be assisting with data interpretation and drafting a manuscript for publication.
In a related project, she has been working with another faculty member to observe opportunities and adherence to hand hygiene in these same facilities. Hundreds of opportunities have been recorded. Ms. [redacted] has entered the data into an Excel file and will be assisting with data analysis and write of these results as well. She will also work with us to help provide feedback to staff about the results of these projects.

Elaine Larson 5/15/15

Signature of Agency Preceptor Date

Student Comments:
I have been afforded exceptional opportunities by Dr. Larson and her team and I have tried to take advantage of them all in addition to making a contribution to the projects mentioned.

[redacted] 5/15/15

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. Special strengths: *Ms. Y is a pleasure to work with. I have no doubt she will do extremely well with her academic and professional goals. I would say a special strength of hers would be intellectual curiosity coupled with a good work ethic. A great combination.*
2. Skills and knowledge needing further improvement: *As with many students (as well as this particular preceptor), working on academic writing is always a good thing.*
3. Other comments: * *Although we did not yet do much data work or analyses, we are just beginning to get moving on that and I feel pretty confident that S will do a very good job based on a number of conversations we had about approaches and issues, which is why I marked her as such on the matrix above.*

Other (please specify):					

Was the internship was useful for your agency? Are there any suggestions you would like to make for the internship program?

This was a wonderful opportunity for CIHE. We have worked with MPH students in the past in other capacities, but the additional activities and requirements of the internship afforded us the opportunity to expand upon a general organizational internship. This allowed us the opportunity to develop more individualized and tailored activities for the student. Additionally, this opportunity helped establish stronger working relationships with the student, which has resulted in her preliminarily planning to build upon this experience by developing her capstone project. This also helped us by providing an additional level of on-site team member that could serve as a mentor and support to the undergraduate interns participating in our summer internship program.

In terms of suggestions, it would be wonderful if there were meetings with the internship coordinator to establish a collaborative support network for the student. Additionally, it would be helpful to have an initial meeting to discuss the potential opportunities at the Institute prior to students selecting or arriving at the site so they can be provided some initial general background about the work of CIHE.

Would you like to continue participating in the Lehman MPH internship program? ***Yes***

Master of Public Health (MPH) Program

Preceptor Final Evaluation of Internship Form

Date: July 18, 2014

Preceptor(s) name: Estelle M. Raboni, MPH, MCHES

Title(s): Director, Changing the Odds

Agency/department: Morris Heights Health Center

Phone: (718) 483-1270 ext. 8152 e-mail: eraboni@mhhc.org

Agency address: 2306 Walton Avenue, Bronx, NY 10468

Name of student intern:

Did the student complete the required 180 hours? x☐ Yes ☐ No

If no, please explain:

A. Please evaluate the student by checking the appropriate box:

	Excellent	Above average	Average	Below Average	No opportunity to observe/does not apply
Work performance					
Arrives on time consistently	**X**				
Uses time effectively	**X**				
Informs supervisor and makes arrangements for absences	**X**				
Reliably completes tasks on time	**X**				
Effectiveness in written communication	**X**				
Effectiveness in oral communication	**X**				

	Excellent	Above average	Average	Below Average	No opportunity to observe/does not apply
Ability to identify problems and troubleshoot	**X**				
Analytical ability	**X**				
Ability to work on a team	**X**				
Overall quality of work produced	**X**				
Other *(please specify)* *Co-facilitation skills*		**X**			

	Excellent	Above average	Average	Below Average	No opportunity to observe/does not apply
Work attitudes					
Accepts responsibility	**X**				
Takes initiative	**X**				
Follows policies, rules, regulations of agency	**X**				
Accepts ideas and suggestions of others	**X**				
Performs tasks with industry and drive	**X**				
Other *(please specify)*					
Professional relationships with:					
Professional staff	**X**				
Support staff					**X**
Supervisor	**X**				
Personnel from other organizations	**X**				
Participants/clients/patients		**X**			
General public	**X**				
Other *(please specify)*					
Application of community health skills					

	Excellent	Above average	Average	Below Average	No opportunity to observe/does not apply
Obtaining & using appropriate information from published and unpublished literature	**X**				
Assessing health problems					**X**
Developing health objectives					**X**
Using health-related data	**X**				
Planning & developing health programs and projects		**X**			
Managing health programs					**X**
Evaluating health programs		**X**			
Data collection activities		**X**			
Analyzing data		**X**			
Other *(please specify)*					

B. Overall Feedback on Internship:

1. Was the internship was useful for your agency? Are there any suggestions you would like to make for the internship program? The internship was extremely useful to our agency and more specifically to our program. J did projects which I did not nor my staff have the time to devote to. She was incredibly diligent and wasn't afraid to ask questions.

2. Would you like to continue participating in the Lehman MPH internship program?
   x☐ Yes ☐ No ☐ Not sure

COMMENTS (Please respond briefly. Use reverse side if necessary):
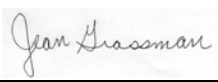
1. Special strengths:
A quality that served Z well in this project was her ability to plan and be proactive. The project included two other graduate students, a Capracare volunteer, and an undergraduate, Phuonise, who translated and entered the data into Excel. I don't believe Z has met any of us face to face, yet she was able to move forward with her project and collaborate with the others. In particular, Z needed to make her needs clear and work with Phuonise in order to prepare the datafile for SAS. She clearly had a good sense of pacing for the project and worked hard to meet her goals.

Z has been an effective communicator based on my interactions with her by email and telephone. She was diligent about reporting on her progress, and let me know when she felt it necessary to discuss stages of the work by telephone. Her descriptions of her plans, progress, concerns, barriers, and results were clear and complete. These remarks include my communications directly with her and instances where she communicated with other members of the team and cc:ed me.

I'm reviewing her analysis and am satisfied. A brief perusal reveals some surprising results which the project will use in follow up—for instance, a substantial percentage of the respondents are burning mosquito coils. This observations highlights the need to check the constituents of the coils to ensure they are not harmful.

Overall, I'm pleased with her work and consider the project fortunate to have her input and participation.



2. Skills and knowledge needing further improvement:
Z is in the early stages of her career as an epidemiologist. To her credit, she asked for assistance in SAS from faculty here at Brooklyn. It was a prudent request, just one I was not able to fulfill. Based on her results, I trust she found the support she needed elsewhere.

3. Other comments:
1) Regarding IRB: Z has been added to the personnel list associated with the IRB protocol **Community Health Education in Rural Haiti**. In the IRBnet system, this project was reviewed by the Board and given an "Exempt" status that extends into 2016. Exempt projects were not transferred to IDEATE which meant the project had to be re-entered so it is currently listed as "Under development".

Z has passed the CITI 1 Basic course and promptly provided me with documentation showing that her training is current. She's been added to the protocol but I'm still waiting for the new system to update the project.

2) Contract: I'd like to highlight that Z completed most of the items on her contract. We were all a bit optimistic about the second phase of the project which involved developing and delivering the mosquito-avoidance workshops in Haiti. The other students have developed drafts of the workshops which need to be refined. The delivery of the workshops has been delayed largely because the US-based Capracare volunteers won't be traveling to Haiti in August as originally planned. The project is following the timeline albeit with an approximately 6 month delay. I plan on drafting a manuscript this fall. I realize this falls outside Z's timeline but hope she can participate since it would give her a chance to work on first-hand on a manuscript and be an author on a publication.

I realize this is a short review. I'm happy to provide further or more specific details.

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. Special strengths:

S is clearly very committed to improving the public health of the Caribbean, fueled by her background and personal experiences. S is very personable and a pleasure to work with. She is flexible and willing to help out with any tasks that are asked of her.

2. Skills and knowledge needing further improvement:

S should continue to strengthen her statistical knowledge and data analysis skills, which she will certainly do as she progresses in her MPH program.

3. Other comments:

I look forward to continuing to work with S through the fall and into the spring. She will have the opportunity to work on a publication on socio-economic correlates of STI among pregnant women in Haiti while she prepares the data for her analysis of gender differences in correlates of STI.

DPH PRACTICUM PROJECT FINAL REPORT (Sponsor)

Student name:
DPH Track: EOH

Practicum sponsor's name: Professor E. A. G. Geltman

Practicum Project description (one sentence):

Instructions

The Practicum Sponsor is to complete this report and provide it to the student, for submission to the Instructor. Both the student and the Practicum Sponsor must sign the report. The final version, with signatures, must be submitted via email to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu). Either the Practicum Sponsor or the student may submit the final signed report.

DEADLINE: May 15, 2015

Overall Practicum Project Assessment

Please check the statement which best summarizes the student's Practicum Project work:

- ☐x Project completed on schedule with initial Learning Plan
- ☐ Project completed ahead of schedule from initial Learning Plan (describe any adjustments in 1.)
- ☐ Project behind schedule from initial Learning Plan (describe any adjustments in 1.)

Practicum Sponsor's Comments on Student Completion of the Practicum Project

This form is to be completed by the Practicum Project sponsor, after meeting with the student and careful review of the student's work to complete the Practicum Project. The form must then be co-signed by the student.

*Please submit the completed form electronically to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu) and include both the student and the sponsor on the message sent.

1. Please comment on the student's work over the Practicum Project period, including anything notable about time and effort, quality of work completed, identified strengths and weaknesses, etc.

The project required intense work during a short period of time in order to assist in preparing backup documents for my testimony before US EPA in an IRIS proceeding.. H put together a briefing book for me with background materials. Briefing books are important during testimony in case a question is asked that goes into specific detail. The briefing book would allow me to quote passages and give specific citations if need be. See attached.

2. Please comment on the student's progress towards mastering the competencies s/he identified as relevant to the Practicum Project's stated objectives and activities. This information is presented in the student's detailed Learning Plan.

H was very pleasant to work with and completed materials on time. He was a good participant in the group and provided keen insights to other students working on separate research projects.

3. Has the student met with you to discuss his/her completion of the Practicum Project? Please briefly describe your meetings over the course of the Practicum Project period, any changes, etc. If you have not met, please explain.
   We met weekly to discuss progress and review materials.

Signature of sponsor: _____Liz Geltman_____ Date: as of 5/15/15_____

To be completed by the student:

☐ I agree with the comments on my Practicum Project progress provided by my sponsor.

☐ I do not agree with the comments on my Practicum Project progress provided by my sponsor.

Please explain:

Signature of student: _____ Date:_____

DPH PRACTICUM PROJECT FINAL REPORT (Sponsor)

Student name:

DPH Track: EOH Project

Practicum sponsor's name: Sherry Baron

Practicum Project description (one sentence):
Conduct a literature review is to determine what is known about diet and BPA exposure in African American women and children and develop an analysis plan using the NHANES data to fill research gaps.

Instructions

The Practicum Sponsor is to complete this report and provide it to the student, for submission to the Instructor. Both the student and the Practicum Sponsor must sign the report. The final version, with signatures, must be submitted via email to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu). Either the Practicum Sponsor or the student may submit the final signed report.

DEADLINE: May 15, 2015

Overall Practicum Project Assessment

Please check the statement which best summarizes the student's Practicum Project work:

- ☐ Project completed on schedule with initial Learning Plan
- ☐ Project completed ahead of schedule from initial Learning Plan (describe any adjustments in 1.)
- x Project behind schedule from initial Learning Plan (describe any adjustments in 1.)

Practicum Sponsor's Comments on Student Completion of the Practicum Project

This form is to be completed by the Practicum Project sponsor, after meeting with the student and careful review of the student's work to complete the Practicum Project. The form must then be co-signed by the student.

*Please submit the completed form electronically to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu) and include both the student and the sponsor on the message sent.

1. Please comment on the student's work over the Practicum Project period, including anything notable about time and effort, quality of work completed, identified strengths and weaknesses, etc.

L focused most of her work this semester on refining the focus for her literature review. She found that her initial literature search identified more than a 100 potential articles and thus she needed to devote time to reading and refining the goals and scope of her topic. This was a good exercise for her as it required her to think critically about her research question and developed a much more focused approach. This became a larger project than she initially planned and thus she was not able to also complete the analysis plan for the NHANES data. While this meant that that she fell behind on her initial objectives, I felt that the additional time spent defining the research gaps was essential and a necessary step before she launched into any analysis of data.

2. Please comment on the student's progress towards mastering the competencies s/he identified as relevant to the Practicum Project's stated objectives and activities. This information is presented in the student's detailed Learning Plan.

L made very good progress in improving her technical writing and in learning to define a clear and specific research question. She also gained technical knowledge about current research approaches and gaps related to her research question.

3. Has the student met with you to discuss his/her completion of the Practicum Project? Please briefly describe your meetings over the course of the Practicum Project period, any changes, etc. If you have not met, please explain.

   We have met approximately every 2 weeks to discuss her progress and to review drafts of her written report.

DPH PRACTICUM PROJECT FINAL REPORT (Sponsor)

Student name: [redacted]

DPH Track: Health Policy and Management

Practicum sponsor's name: Alice Berger

Practicum Project description (one sentence):
[redacted] is working at Planned Parenthood of New York City to improve the knowledge and build the capacity of family planning providers and other organizations to assist individuals with enrollment in health insurance, including the Medicaid Family Planning Benefit Program (FPBP), the Family Planning Extension Program (FPEP), and the impact of the Affordable Care Act (ACA) on FPBP, FPEP, and coverage and access to family planning and other reproductive health services.

Instructions

The Practicum Sponsor is to complete this report and provide it to the student, for submission to the Instructor. Both the student and the Practicum Sponsor must sign the report. The final version, with signatures, must be submitted via email to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu). Either the Practicum Sponsor or the student may submit the final signed report.

DEADLINE: May 15, 2015

Overall Practicum Project Assessment

Please check the statement which best summarizes the student's Practicum Project work:

- **X** Project completed on schedule with initial Learning Plan
- ☐ Project completed ahead of schedule from initial Learning Plan (describe any adjustments in 1.)
- ☐ Project behind schedule from initial Learning Plan (describe any adjustments in 1.)

Practicum Sponsor's Comments on Student Completion of the Practicum Project

This form is to be completed by the Practicum Project sponsor, after meeting with the student and careful review of the student's work to complete the Practicum Project. The form must then be co-signed by the student.

*Please submit the completed form electronically to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu) and include both the student and the sponsor on the message sent.

1. **Please comment on the student's work over the Practicum Project period, including anything notable about time and effort, quality of work completed, identified strengths and weaknesses, etc.**

   [redacted] is an excellent trainer and has demonstrated a great deal of expertise about FPBP, FPEP, and the impact of the ACA. She has the ability to synthesize complex information in order to explain it in clear and concise terms to an audience with varying levels of knowledge and skill. Conducting education on the ACA has tested her skill of keeping things simple and relevant and she has risen to that challenge. She is also open to constructive feedback. She has improved her activities tracking efforts since we submitted the progress report, so I am confident that it will result in a more meaningful analysis in her own final report.

2. **Please comment on the student's progress towards mastering the competencies s/he identified as relevant to the Practicum Project's stated objectives and activities. This information is presented in the student's detailed Learning Plan.**

   Through this project, [redacted] has mastered the ways in which public policy interventions can be operationalized in the health care setting. She has been able to experience first-hand, how the policy process is implemented as it works is way through an organization's infrastrucure. She has improved her ability to analyze the outcomes of policy decisions on access to health care and coverage. She is also now able to distinguish how policy implementation can vary across health care settings and organizations, depending on the staffing capacity, internal group dynamics, leadership, and patient demographics. [redacted] has been able to read through complex literature, including regulations and subregulations, regarding Medicaid and Title X requirements to understand and evaluate its potential impact. She can then clearly and concisely summarize the literature and provide her own, informed assessment to health care providers.

3. **Has the student met with you to discuss his/her completion of the Practicum Project? Please briefly describe your meetings over the course of the Practicum Project period, any changes, etc. If you have not met, please explain.**

   [redacted] and I meet almost daily to talk about her work. She will update me on her activities and describe both the opportunities and challenges she experienced while doing the trainings and conducting technical assistance. She will then provide her own assessment and reflect on these experiences. I typically offer my own feedback and ask her additional questions. If there are any federal or state policy updates relevant to the project, she and I will discuss first and think about how to implement any new information into the trainings she provides.

DPH PRACTICUM PROJECT FINAL REPORT (Sponsor)

Student name: [redacted]

DPH Track: Epidemiology

Practicum sponsor's name: Amber Levanon Seligson

Practicum Project description (one sentence):
Report on the Wellness of Supportive Housing Participants

Instructions

The Practicum Sponsor is to complete this report and provide it to the student, for submission to the instructor. Both the student and the Practicum Sponsor must sign the report. The final version, with signatures, must be submitted via email to the seminar instructor (Daliah Heller, daliah.heller@sph.cuny.edu). Either the Practicum Sponsor or the student may submit the final signed report.

Overall Practicum Project Assessment

Please check the statement which best summarizes the student's Practicum Project work:

- [X] Project completed on schedule with initial Learning Plan
- [ ] Project completed ahead of schedule from initial Learning Plan (describe any adjustments in A.VIII.)
- [ ] Project behind schedule from initial Learning Plan (describe any adjustments in A.VIII.)

Note from project sponsor Amber Levanon Seligson: The deliverables for [redacted] practicum included drafting a report about well-being of supportive housing participants, including charts and figures and information about statistical techniques used in analyzing the data; SAS code used to conduct analyses; and data-checking with colleagues in the Program Evaluation Unit. A partial draft of the report has been written. The draft is a "synopsis," meaning that not all parts of the draft are included yet. Sal has made substantial contributions to this synopsis draft, including tables from analyses and information about statistical techniques, he has written SAS code, and he has worked with colleagues to data-check his analyses. Therefore, I consider his practicum work to be complete. He will continue to work on this project to bring the report to completion, and that continued work is outside the scope of the practicum.

Practicum Sponsor's Comments on Student Completion of the Practicum Project

This form is to be completed by the Practicum Project sponsor, after meeting with the student and careful review of the student's work to complete the Practicum Project. The form must then be co-signed by the student.

*Please submit the completed form electronically to the seminar instructor (Daliah Heller, daliah.heller@sph.cuny.edu) and include both the student and the sponsor on the message sent.

1. **Please comment on the student's work over the Practicum Project period, including anything notable about time and effort, quality of work completed, identified strengths and weaknesses, etc.**

Mr [redacted] has made substantial progress in contributing to a valuable draft report that we have been working on in the Program Evaluation Unit of the Bureau of Epidemiology Services. Mr [redacted] has worked very hard to (1) learn about our program evaluation, (2) understand the data that we have available to us, (3) identify Citywide data that need to be used, (4) choose methods for analyses, (5) run analyses, (6) check analyses, and (7) report results.

I have been very impressed by Mr. [redacted]s efforts to undertake this complex project. Although at first glance it may seem that the questions we are trying to ask in the report are simple and the analyses are straightforward, the work to undertake these tasks has actually been very complex. Mr. [redacted] at times has expressed surprise by how long the process has taken for our unit to work through analytic decisions and try different approaches. I am glad that he has remained dedicated to the project and tried different approaches, and has been open to exploring new paths when the paths we have gone down have need to be modified.

Mr [redacted] has been a terrific member of our team. He is an enthusiastic analyst who wants to understand the details of the project and wants his analyses to be done well and using the most appropriate methods and data. I very much appreciate this spirit, and am so glad that we have had a chance to work with him on this project.

2. Please comment on the student's progress towards mastering the competencies s/he identified as relevant to the Practicum Project's stated objectives and activities. This information is presented in the student's detailed Learning Plan.

Mr. [redacted] has made progress in the following areas:

- To understand the requirements of a DOHMH Special Report and help produce the report
  - Mr. [redacted] has been an integral part of our team in deciding about the analyses that need to be conducted about mortality, and how to include them in a report. He has conducted data analyses for the report, worked with colleagues to check those analyses, and written up his results.
- To achieve proficiency in the use of statistical software in an agency setting
  - Mr. [redacted] has worked within our computing environment, and has written SAS code to conduct analyses. He has documented his SAS code, and worked with colleagues to resolve issues in SAS codes when needed so that they agree on results of analyses.
- To learn how to do a thorough analyses of mortality for an at-risk population
  - Mr. [redacted] has explored appropriate methodologies for analyzing mortality, and calculating rates and confidence intervals. He has learned about the detailed decisions that need to be made when a program evaluation population is being compared to city-wide rates or rates in lowest income neighborhoods.
- To evaluate the NY/NY III Supportive Housing intervention
  - Mr. [redacted] has made an important contribution to our efforts to evaluate NY/NY III by conducting a rigorous mortality analysis.

3. Has the student met with you to discuss his/her completion of the Practicum Project? Please briefly describe your meetings over the course of the Practicum Project period, any changes, etc. If you have not met, please explain.

Mr [redacted] and I talk at least once a week about specific elements of the project. We problem-solve about various analytic decisions that need to be made.

DPH PRACTICUM PROJECT FINAL REPORT (Sponsor)

Student name: [redacted]

DPH Track: Health Policy and Management

Practicum sponsor's name: Yi Han

Practicum Project description (one sentence): This project was conducted by the student to 1) better understand what publically available data sources are available to better understand healthcare utilization and costs among the elderly and 2) analyze and interpret some of this data to prepare for a future publication to share findings.

Instructions

The Practicum Sponsor is to complete this report and provide it to the student, for submission to the Instructor. Both the student and the Practicum Sponsor must sign the report. The final version, with signatures, must be submitted via email to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu). Either the Practicum Sponsor or the student may submit the final signed report.

DEADLINE: May 17, 2015

Overall Practicum Project Assessment

Please check the statement which best summarizes the student's Practicum Project work:

- [X] Project completed on schedule with initial Learning Plan
- [ ] Project completed ahead of schedule from initial Learning Plan (describe any adjustments in 1.)
- [ ] Project behind schedule from initial Learning Plan (describe any adjustments in 1.)

Practicum Sponsor's Comments on Student Completion of the Practicum Project

This form is to be completed by the Practicum Project sponsor, after meeting with the student and careful review of the student's work to complete the Practicum Project. The form must then be co-signed by the student.

*Please submit the completed form electronically to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu) and include both the student and the sponsor on the message sent.

1. **Please comment on the student's work over the Practicum Project period, including anything notable about time and effort, quality of work completed, identified strengths and weaknesses, etc.**

Despite some challenges that [redacted] faced finding an appropriate data source to start, I think this modified exercise was very productive in helping her to take time to explore publically available data around this issue. The table developed will be a valuable reference for future research and can continue to be built upon as more data sources are identified. Further, once [redacted] identified these resources, she took time to go through them to identify what data relevant to her research interests could be extracted/analyzed from these data sets. [redacted] put together a meaningful and quality report for this practicum project and I would be happy to continue to support her through similar work in the future.

2. **Please comment on the student's progress towards mastering the competencies s/he identified as relevant to the Practicum Project's stated objectives and activities. This information is presented in the student's detailed Learning Plan.**

Based on the progress that [redacted] has made on this project, she is certainly closer to mastering the competencies that she identified. All of the competencies around understanding and applying research designs/analysis and data interpretation will be skills that [redacted] will continue to evolve throughout her academic and professional career. Based on [redacted]s findings, we will continue to work together over the summer to translate these learnings into a tangible abstract or publication that can be submitted to a conference or journal (likely ISPOR).

3. **Has the student met with you to discuss his/her completion of the Practicum Project? Please briefly describe your meetings over the course of the Practicum Project period, any changes, etc. If you have not met, please explain.**

Yes, [redacted] and I met to discuss the project at the completion. We went over the key findings and her first draft of the report. Throughout the semester, we met periodically to discuss the project although timing was sometimes a challenge as we travel often for work. After the completion of this practicum project, [redacted] and I plan to continue to meet to create a publication out of this initial work.

Signature of sponsor:  **Date: 5/15/2015**

To be completed by the student:

☒ I agree with the comments on my Practicum Project progress provided by my sponsor.

☐ I do not agree with the comments on my Practicum Project progress provided by my sponsor.

DPH PRACTICUM PROJECT FINAL REPORT (Sponsor)

Student name: [redacted]

DPH Track: EOH

Practicum sponsor's name: Jean Grassman

Practicum Project description (one sentence): **Organize a workplace union health and safety committee using issues of workplace hazards stemming from deferred maintenance.**

Instructions

The Practicum Sponsor is to complete this report and provide it to the student, for submission to the Instructor. Both the student and the Practicum Sponsor must sign the report. The final version, with signatures, must be submitted via email to the seminar instructor (Daliah Heller, daliah.heller@sph.cuny.edu). Either the Practicum Sponsor or the student may submit the final signed report.

DEADLINE: May 15, 2015

Overall Practicum Project Assessment

Please check the statement which best summarizes the student's Practicum Project work:

- XX Project completed on schedule with initial Learning Plan
- ☐ Project completed ahead of schedule from initial Learning Plan (describe any adjustments in 1.)
- ☐ Project behind schedule from initial Learning Plan (describe any adjustments in 1.)

Practicum Sponsor's Comments on Student Completion of the Practicum Project

This form is to be completed by the Practicum Project sponsor, after meeting with the student and careful review of the student's work to complete the Practicum Project. The form must then be co-signed by the student.

*Please submit the completed form electronically to the seminar instructor (Daliah Heller, daliah.heller@sph.cuny.edu) and include both the student and the sponsor on the message sent.

1. Please comment on the student's work over the Practicum Project period, including anything notable about time and effort, quality of work completed, identified strengths and weaknesses, etc.

   [redacted] approached the project in a methodical and organized manner. She was diligent in her research: performing analyses, developing summaries, and listing hazards in a timely manner. She approached the work with great enthusiasm and was a pleasure to work with. Her attitude was both critical and constructive. She amply demonstrated leadership skills by taking the lead in group discussions at meetings held at the PSC and at Brooklyn College.

   I would have liked to have had her take a bit more initiative in the direction of some of our activities. In particular, I would have liked her to been able to devise and propose next steps following events such as meetings where we learned about the problems faced by members.

   At least part of the reason for this not happening to a greater extent may be because of the labor union context: I had mentioned early on in the project that she needed to clear activities with me to ensure that the rights and privacy of the members were maintained. One reason this is important is because most CUNY campuses consist of a mixture of non-union Administration, PSC members, and members from other unions. When we work at the campuses, we want the PSC members to trust us with their issues and not alert their supervisors without their permission, something that can easily happen when not knowing the players and their roles.

2. Please comment on the student's progress towards mastering the competencies s/he identified as relevant to the Practicum Project's stated objectives and activities. This information is presented in the student's detailed Learning Plan.

   Based on review of the learning plan, [redacted] completed her learning objectives with the modification described in the mid-semester review where we mutually decided it would be best to focus on Brooklyn College.

   The competencies that [redacted] chose were appropriate for the project and she attained them. Her project drew most from competencies related to policy analysis and advocacy, applying concepts, theories and methods to the study of public health, and leadership/teamwork skills.

She also had opportunity to do research/data collection although the data that was collected was qualitative in nature.

3. Has the student met with you to discuss his/her completion of the Practicum Project? Please briefly describe your meetings over the course of the Practicum Project period, any changes, etc. If you have not met, please explain.

[redacted] and I had a standing meeting every week at the PSC Union Hall on Wednesdays at 4 pm. These meeting were invaluable in maintaining the focus and trajectory of the project. Our last meeting will be on May 20 where we review this document and plan the last activity of the practicum which is encouraging members to contact the Administration about workplace temperature problems.

DPH PRACTICUM PROJECT FINAL REPORT (Sponsor)

Student name:

DPH Track: EOH

Practicum sponsor's name: Liz Geltman

Practicum Project description (one sentence):
Cross sectional survey of TENORM health and safety regulation in oil and gas operations

---

Instructions

The Practicum Sponsor is to complete this report and provide it to the student, for submission to the Instructor. Both the student and the Practicum Sponsor must sign the report. The final version, with signatures, must be submitted via email to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu). Either the Practicum Sponsor or the student may submit the final signed report.

DEADLINE: May 15, 2015

Overall Practicum Project Assessment

Please check the statement which best summarizes the student's Practicum Project work:

- ☐ Project completed on schedule with initial Learning Plan
- ☐ Project completed ahead of schedule from initial Learning Plan (describe any adjustments in 1.)
- ☐X Project behind schedule from initial Learning Plan (describe any adjustments in 1.)

Practicum Sponsor's Comments on Student Completion of the Practicum Project

This form is to be completed by the Practicum Project sponsor, after meeting with the student and careful review of the student's work to complete the Practicum Project. The form must then be co-signed by the student.

*Please submit the completed form electronically to the seminar Instructor (Daliah Heller, daliah.heller@sph.cuny.edu) and include both the student and the sponsor on the message sent.

1. Please comment on the student's work over the Practicum Project period, including anything notable about time and effort, quality of work completed, identified strengths and weaknesses, etc.

H worked as a member of our TENORM study group. There were five team members, including myself.

H conducted the initial literature review while the other three students researched health and safety regulations for TENORM in the oil and gas industry. Our focus was on residential and worker safety protections for those working in or living by the extraction industry as well as those exposed to oil and gas wastes at landfill, POTWs and other locations accepting wastes that might include TENORM.

Three EOHS MPH candidate coders collected law, regulation and policy concerning TENORM using the LEXIS/NEXIS database and coded the results in LawAtlas Workbench, a software variation of Atlas.ti that was developed bytthe Network for Public Health Law Research and the Robert Wood Johnson Foundation. The coders copied relevant portions of law or regulation into LawAtals to support the coding. My instructions was to be overinlcusive when copying material, with the expectation that we would edit out irrelevant materials as the study progressed. The three coders traded states and verified coding. The three coders then did a search of state and local websites looking for policies not included in LEXIS/NEXIS. The team met weekly to discuss coding discrepancies. The team also discussed changes in coding policy as dictated by research results

H acted as naïve coder verifying the coding of all 50 states for the three prior coders. His research was exhaustive and differed significantly from the three prior coders on many states.

In order to prepare the TENORM study for publication, the three coders were asked to edit the entries in LAwAtlas so only the relevant laws or regulations would appear. The coders were also instructed to be sure the font, citation and syntax were uniform from state to state throughout the data set. H was put in charge of preparing the project for publication.

Once the above is complete, the final portion of the dataset requires preparation of a codebook, protocol and report.

The codebook is largely self-generated by LawAtlas, but must be edited.

.

2. Please comment on the student's progress towards mastering the competencies s/he identified as relevant to the Practicum Project's stated objectives and activities. This information is presented in the student's detailed Learning Plan.

H completed a thorough literature review outlining the health issues concerning TENORM.

H's reading of the laws and regulations differed significantly from the other three coders. Rather than taking a week or two to complete the naïve coding, the process evolved into over two months and is still not complete. I plan to review the items state by state this summer to determine whether the H's concerns were insightful or without merit.

H had difficultly supervising the master's students to standardize citation in workbench and be sure only relevant materials were included as supporting documentation. While he raised concerns about coding, he had difficulty suggesting alternative methods to convey the data in a way that met his concerns.

At this writing, the study is delayed. Issues still need to be clarified as H's interpretation on many coded items disagree from the prior three coders. The text of the law/regulations in LawAtlas still need to be edited to be uniform and the citation must also be corrected. The protocol book needs to be created, as does the final report.

The project was not able to proceed to writing the report for publication on LawAtlas or to drafting an article for publication as the process of naïve coding took significantly longer than expected and is still not complete.

H did a significant amount of work on this project and did an outstanding job of assembling the materials he and his team members drafted this semester into a final report.

3. Has the student met with you to discuss his/her completion of the Practicum Project? Please briefly describe your meetings over the course of the Practicum Project period, any changes, etc. If you have not met, please explain.

Yes, the team met almost weekly. H was an active participant in the meetings, usually arrived early and never missed a meeting.

<u>To be completed by the student:</u>

☐x I agree with the comments on my Practicum Project progress provided by my sponsor.

☐ I do not agree with the comments on my Practicum Project progress provided by my sponsor.

Please explain:

While I agree with the comments, I would like to elaborate on a few details:

I was approaching the code questions not with fresh eyes like the three group members but with a lot of experience and technical background behind me on the subject. Naturally, my background in the field has influenced my judgment in many ways during the project.

I would like to mention that I have been in the field of radiation control for over 20 years and I am also a Certified Health Physicist by the American Board of Health Physics. As a Health Physicist (also referred to as a radiation protection specialist), I am expected to address a number of health and safety issues arising from a variety of radiation sources (for which TENORM is only one piece) including their regulatory implementation. In all my experience, radioactive materials are regulated more or less in the same way under the same general structure and regulatory instruments (through licensing, inspection, standards of protection, exemption, exclusion etc.). Thus, I was approaching the problem in the practicum project with this mind set while the other members were looking at it free from any bias. Therefore, I believe such a wide discrepancy between the rest of the project team and I should be expected.

I agree with Prof. Geltman on the point about my difficulty on suggesting alternative methods. Looking back, I should probably have followed a more assertive approach in conveying my messages. However, the question of whether there should be industry specific TENORM law (in this case for oil and gas) instead of a general TENORM law, irrespective of its origin, has been an ongoing discussion and not specific to this project. As such, my background dictated me to follow a non-industry specific approach in the coding process as opposed to what the group generally believed. In this regard, I agree I had difficulty convincing the merits of my approach to anyone but in the end I decided to follow the position of the group, the result of which was a delay in the project. Nevertheless, Prof. Geltman's position to verify whether or not my concerns have merits is reasonable. I believe where and how my concern came from will be taken into consideration in verifying the position I took on the different TENORM issues.

CUNY SCHOOL OF PUBLIC HEALTH

COURSE SYLLABUS

Brooklyn College
Department of Health and Nutrition Sciences

HNSC 7920X: Supervised Fieldwork in Public Health

3 Credits - Fall 2015

Time and location	Thursdays, 6:30-9:00 – Room 3424 Ingersoll Hall
Instructor	Bill Stackhouse, Ph.D. Adjunct Assistant Professor **Best to contact by email.** • Office: Ingersoll 4423 • Phone: 718.951.5000 x5026 (leave a message & you'll get a call or e-mail response) • E-mail: RWStackhouse@brooklyn.cuny.edu
Office hours	By appointment – before or after class.
Course website	https://bbhosted.cuny.edu/webapps/blackboard/
Support resources	For technical assistance, contact the Helpdesk. Academic support services writing skills assistance are available.
Course description	Students carry out 180 hours of supervised field work that is intended to bridge academic preparation and public health practice. Knowledge and skills from the core MPH and specialization courses are applied in a public health agency, community organization or other setting relevant to the student's academic background, specialization and career expectations. This is accomplished under the supervision and guidance of an experienced preceptor. Field-based hours are implemented with classroom and individual meetings along with online communication. Aside from deliverables required by the preceptor, the student develops a reflection paper, a self-evaluation and a capstone proposal.
Course prerequisites	Completion of at least 18 MPH credits that include Health and Nutrition Sciences 7120X, Health and Nutrition Sciences 7150X, and two courses in the student's area of specialization.
Course format	Supervised individual internship projects in a community program or health agency. Weekly seminars, except when noted in the posted schedule. NOTE: the Internship Manual for Fall 2015 is an official part of this syllabus.
Required reading	There is no required textbook. Weekly reading assignments

and resources	appear following the class schedule herein. Articles and other materials will be posted on BlackBoard.
Suggested reading and resources	Optional reading materials and learning resources will be posted to BlackBoard, particularly in relation to current newsworthy topics in public health.

Core Competencies	Course Learning Objectives	Assessment Methods
This course will help you to:	*After successfully completing this course, you are expected to be able to:*	*Competencies and learning objectives will be assessed as part of the following course assignments:*
1. Apply the public health core functions of assessment, policy development and assurance	• Demonstrate (e.g. through the portfolio) the application of assessment, assurance and/or policy development during the fieldwork experience.	• Addressed in: Classes - 1,2,3,4,5, & internship placement • Assessed in: Learning objectives, Logic model, Gantt chart, all 3 reflection papers
2. Apply theories, concepts, models and methods to the design of public health research, policy and practice	• Demonstrate through self-reflection activities the application of one or more core PH values or techniques through the fieldwork experience	• Addressed in: 1,2,3,4,5 & internship placement • Assessed by: Learning objectives, Logic model, Gantt chart, poster, all 3 reflection papers, poster presentation
3. Adhere to ethical and social justice principles and standards	• Apply ethnical principles to fieldwork placement, (e.g. human subjects' protection principles to the data collection). • Assess the degree to which the fieldwork placement agency adheres to ethical principles and standards	• Addressed in: 4 and internship placement • Assessed by: Reflection paper 1
4. Interpret and analyze public health literature and apply evidence-based research	• Demonstrate (e.g. through the portfolio) the application of findings from public health literature to the field work experience	• Addressed in: 1,2,3,4,5,6,7 & internship placement • Assessed by: Learning objectives, Logic model, Gantt chart, poster, all 3 reflection papers, poster presentation
5. Apply basic statistical and informatics techniques	• Participate, through the fieldwork experience, in using statistical and informatics techniques to support a public health program or policy in it's provision and effectiveness.	• Addressed in: Internship placement – when required in the internship setting and experience • Assessed by: poster presentation and poster
6. Communicate public health information through oral, written, digital and visual presentation	• Prepare written and oral progress and evaluation reports (e.g. the fieldwork project), using appropriate professional formats.	• Addressed in: 10, 11, 13, 14 & Class participation and internship placement • Assessed by: Learning objectives, Logic model, Gantt chart, abstract, all 3 reflection papers, poster presentation and poster
7. Explain how social, behavioral, biomedical and environmental determinants affect population health	• Apply the elements of social, behavioral, biomedical and environmental determinants of and inequities in health and disease to aspects of the provision of public health activities in the internship settings and activities.	• Addressed in: 2,3,4,6,9 & internship placement • Assessed by: Logic Model, reflection paper 1, poster presentation and poster

8. Design and evaluate interventions to prevent or control public health problems	• Participate, through the fieldwork experience, in developing, carrying or evaluating out a public health program, remediation measure or policy.	• Addressed in: Internship placement – when required in the internship setting and experience • Assessed by: Learning objectives, Logic model, Gantt chart, abstract, all 3 reflection papers, poster presentation and poster
9. Collect, analyze and interpret public health data	• Participate, through the fieldwork experience, in collecting, analyzing and interpreting public health data to support a public health program or policy in it's provision and effectiveness.	• Addressed in: Internship placement – when required in the internship setting and experience • Assessed by: poster presentation and poster
10. Engage and collaborate with diverse groups	• Identify different stakeholders and evaluate their roles on the fieldwork project.	• Addressed in: 2,4,5,7,& internship placement • Assessed by: summary paper, poster presentation and poste
11. Describe the legal foundations of the U.S. public health system and its interrelationships with other systems including health care, education and environmental protection	• Apply the elements of public health core elements, infrastructure, and delivery to aspects of the provision of public health activities in the internship settings and activities.	• Addressed in: 2,3 & internship placement • Assessed by: reflection paper 1
12. Apply a framework for the planning, implementation and evaluation of public health programs, policies and interventions	• Explain the difference between key planning constructs and demonstrate the ability to incorporate them in planning, implementing and evaluating the fieldwork project	• Addressed in: 1,2,3,4,10, & internship placement • Assessed by: Learning objectives, Logic model, Gantt chart, summary paper
13. Explain the context of public and private health-care systems in which health care and public health policy are made and healthcare is delivered	• Discuss how the agencies you worked with during your fieldwork experience deliver health care to the populations they serve.	• Addressed in: 2,3,6,7,9,10 & internship placement • Assessed by: Learning objectives, Logic model, Gantt chart, poster, all 3 reflection papers, summary paper, poster presentation and poster

Course Assessments

The following summary of course assignments & assessments will be presented by the five major required elements of the course work:

1. Field work/Internship
2. Attendance/participation
3. Reflection Papers
4. Supporting and Summary documents
   (Contract elements, learning objectives, Gantt, Logic Model, Summary)
5. Poster/Oral presentation

Additional detailed instructions regarding the arrangements for the internship and the assignments can be found in the Internship Handbook available at the BlackBoard.

All assignments are to be submitted electronically through BlackBoard.

1. Field Work/Internship:
   The internship grade will based on the quality of the contract elements that are submitted, field supervisor comments, assessment of the quality of your service and difficulty of the placement (midpoint and final reviews). **Students should have secured an internship before the first class. Failure to do so may compromise the delivery of timely products and course standing.**

   A. Contract elements include:
   (see class schedule below for due dates)

   - Student information form (available electronically on Blackboard)
   - Supervisor information form (available electronically on Blackboard)
   - Signed student/supervisor agreement form (submitted as a pdf of the signed copy of the last page of the manual)
   - *Approved learning objectives**
   - *Approved logic model** (see: http://www.wkkf.org/knowledge-center/resources/2006/02/WK-Kellogg-Foundation-Logic-Model-Development-Guide.aspx) (Also, use the sample format available on Blackboard)
   - *Approved Gantt chart** (Use the sample format available on Blackboard)
   - *Human Subjects Basic Course* – Complete the Human Subjects Basic Course at the Collaborative Institutional Training Initiative (CITI) online site: https://www.citiprogram.org/ In creating your individual user login account when asked for the institution indicate CUNY, then follow the prompts to set up your account. After establishing your account you will be able to complete the online course for free. Submit the PDF certificate confirming completion.

- Proof of professional liability insurance (for students not working within another office/department of their current employer). Students should research the best option. Look for student packages for 1 semester covering liability between $1m/$3m. Two possibilities are described in the Manual (note: these are not endorsements).
- *Abstract**. First draft. See manual.
  *Note-Professor will review one draft. The next & final iteration will be graded.

Contract elements not due within first three weeks include:

- *Final Abstract** see guidelines in the Manual. This must be submitted by the last class.
- Approved Inter-agency affiliation agreement. This is to be completed and executed before the end of the course. An electronic copy must be given to Barbara Allier, copy to Professor Stackhouse using Blackboard. (Template available at: http://web.cuny.edu/academics/info-central/wwww/affiliation-agreements.html)

B. Midpoint review. Described in detail in the Manual.

- Student mid-point self evaluation, signed by supervisor. (Available on Blackboard).

C. Final Evaluation. Described in the Manual.

- Student Fieldwork Site Evaluation Form (Available on Blackboard). To be submitted electronically to Barbara Allier, copy to Professor Stackhouse using Blackboard.
- Completed timesheets – MPH students must document completion of 180 hours. (Blank forms Available on Blackboard) – Multiple pages with a cover summary page should be scanned to one PDF document with signatures and submitted electronically to Professor Stackhouse using Blackboard.
- Field supervisor final evaluation of student (The final evaluation form will be emailed to the site supervisor by Professor Stackhouse one week before the end of classes and returned to Professor Stackhouse). Note, failure of the supervisor to return the completed evaluation before grades are due may result in a delay of grade submission.

D. Guidelines for all materials to be submitted in fulfillment of course requirements noted above.

  - In addition to the detailed instructions for materials found in the Fieldwork Handbook the following standards apply:
  - The Reflection Papers & the Summary Document should have a title, your name, the date submitted, and include an

introduction, body and conclusion. These documents should be paginated.
- As noted in the Handbook, any time a reference is made the APA reference format is required.
- **All materials submitted** are required to have a document name using the following naming convention (This holds for all types of saved electronic documents – MSWord, Excel, PDF, or any other):
    - Last name.First initial. document name.MM.DD.YR (sample below)
    - Smith.M.ReflectionPaper1.09.15.15

2. Attendance:
   Attendance is mandatory and absences will result in reduced credit unless excused before the class by email; please arrive on time and make sure that all cell phones are silenced.

3. Reflection papers:
   Purpose of each reflection paper is to structure and organize student's learning experience against stated learning objectives, to facilitate synthesis of field activities, and to facilitate integration of theory and practice. Each reflection paper must be submitted to Professor Stackhouse using Blackboard by the end of the day (11pm) on the due date. Late papers will not be accepted unless cleared with Professor Stackhouse in advance. Paper are: #1 – Core Functions of Public Health, #2 – Evidence Based Public Health, and #3 – Leadership VS Management. Please see the manual for further instructions.

4. Summary document/evaluation:
   This summary should be at least a five page overview that critically describes your internship responsibilities, and major findings. The summary should be more than a description of what you did, it should contain insights about unexpected learnings and looking back, what you might have done differently. To be clear, admitting that an internship was not perfect is not a weakness. Indeed, identifying potential areas for improvement (either your own or the organization's) is at the core of what the internship is meant to deliver. **If you have produced a report, document or other final product(s) during your work at the internship, it (they) should be referenced and attached as an appendix. The final document should include itemized references to your learning objectives and clearly identify progress made and challenges faced.**

5. Posters:

Posters & their presentation represent a public display of your internship. Detailed instructions for the poster format appear in the Manual. Samples of posters from previous classes will be available at the BlackBoard along with a blank format for your use. Arrangements will be made with the Brooklyn College Library to print the posters at a discounted price. Note: this must be a professional poster. Posters not meeting professional expectations will not earn a passing grade.

Grading

Evaluation criteria

All assessment elements will be assigned a percentage grade & the final grade will be based on the combined grades based on their percentage weights.

The relative weight of each course component is as follows:

Assessment	Weight
Field Work	30%
Attendance/Participation	10%
Three Reflection Papers	30%
Supporting & Summary Documents	20%
Poster and Oral Presentation	10%
FINAL GRADE	100%

The grading system for the course follows guidance in the Graduate Bulletin.

Letter Grade	Quality Points	Percentage
A+	4.0	97.5 - 100
A	4.0	92.5 - 97.4
A-	3.7	90.0 - 92.4
B+	3.3	87.5 - 89.9
B	3.0	82.5 - 87.4
B-	2.7	80.0 - 82.4
C+	2.3	77.5 - 79.9
C	2.0	70.0 - 77.4
F	0	<70

Withdrawal

If an emergency arises, the student must immediately notify the instructor and agree upon a course of action, especially if the student is unable to complete the course. Students are permitted to officially withdraw from courses without academic penalty generally up until the 10th week of class. The specific policies and dates for withdrawal are available online. Only the student (not the instructor or staff) may officially withdraw from a course. Failure to officially withdraw may result in an “unofficial withdrawal” (WU), which is equivalent to a grade of F, or 0 averaged into your GPA.

Grade of incomplete
Incomplete final grades will not be granted unless the request is justified by legitimate and documented emergencies. The granting of an incomplete grade is at the discretion of the instructor; there is no absolute right to a grade of incomplete. In the case that an incomplete grade is granted, the student must negotiate and prepare a signed contract with the instructor specifying the terms and timeline for completion of all outstanding work. Refer to the Graduate Bulletin and the Program Director for further details.

Grade appeals
When a student considers a final course grade unsatisfactory, the student should first confer with the instructor. If the student is still not satisfied, the student should promptly contact the Program Director in writing giving the factual reasons and basis for the complaint. A student who wishes to appeal a grade must initiate the process in the full semester following the one in which the contested grade was received. For further guidance, refer to the Graduate Bulletin.

Course Policies

Attendance and class participation

Attendance is a significant requirement of the class & attendance will be taken at each session. Students are expected to have read the assignments prior to the class and come prepared for discussion of the materials in relation to the in class presentations by Professor Stackhouse.

Late/incomplete submission of assignments

Late or incomplete submission of assignments will be accepted if there is a specific advance approval given by Professor Stackhouse. Assignments submitted late without advance approval within one week of the due date will be accepted & graded and the grade will be dropped by 10 percentage points. Note – BlackBoard gives documentation of the date and time that assignments are submitted.

Make-ups, rewrites, and extra credit

Make-ups and rewrites are not allowed. However, it should be noted that for the "Contract Elements" a first draft is submitted & returned with detailed feedback. The final copies of these items submitted three weeks after the first draft will be graded. The class does not offer extra credit opportunities

Expectations of students

Students are expected to be in class on time & to be prepared by having read the assigned materials. Mobile devices should be silent. No texting during class is allowed. If a topic arises in class discussion that may benefit from an online search, this will be

acceptable. In general laptops, tablets & smart phones should only be used to view saved electronic copies of class materials. Students will respect each other & fully participate in class discussions.

Expectations for the instructor

Students can expect respectful and professional interaction by Professor Stackhouse. He will post the PowerPoint presentations planned for class sessions one day prior to the class. All class assignments will be reviewed and comments/feedback will be offered within the BlackBoard system in a timely manner. Detailed “track changes” edits and comments will be given to written materials submitted. These are given not to suggest edits or rewrites but to offer feedback to students in relation to ways to improve future assignments. Professor Stackhouse will check Brooklyn College email approximately 4x a week & respond as soon as he is able.

Accessibility

In order to receive disability-related academic accommodations, students must first register with the Center for Student Disability Services. Students who have a documented disability or suspect they may have a disability are invited to set up an appointment with the Director of the Center for Student Disability Services, Ms. Valerie Stewart-Lovell, at (718) 951-5538. If you have already registered with the Center for Student Disability Services, please provide your professor with the course accommodation form and discuss your specific accommodation with him/her.

Academic integrity

The faculty and administration of Brooklyn College support an environment free from cheating and plagiarism. Each student is responsible for being aware of what constitutes cheating and plagiarism and for avoiding both. The complete text of the CUNY Policy on Academic Integrity and the Brooklyn College procedure for implementing the policy can be found at www.brooklyn.cuny.edu/bc/policies. If a faculty member suspects a violation of academic integrity and, upon investigation, confirms that violation, or if the student admits the violation, the faculty member MUST report the violation.

Course Schedule *(Schedule is subject to change)*

Class Meetings HNSC 7920 – Fall 2015 (Thursdays 6:30-9:00pm)

1 – Aug 27 Introduction to Class; expectations, role, planning for the internship

2 – Sept 3 Public Health Core Functions

X – Sept 10 (No Class) College on Monday Schedule

3 - Sept 17 Public Health Infrastructure and Delivery
(First draft of all "Contract Elements" - *due 9/16*- letter A)

4 – Sept 24 Ethics and Methods (including community-based participatory research & human subjects' protection principles in data collection)

5 – Oct 1 Evidence Based Public Health Education (Reflection Paper #1 - *due 9/30*: Core functions)

6 – Oct 8 Public Health in Practice I: An in-depth review of Health Education to address Asthma (Final drafts of "Contract Elements" - *due 10/7- except final abstract*)

7 – Oct 15 Challenges and Opportunities: Internship at the Midpoint (Reflection Paper # 2 - *due 10/14*: Evidence Based Public Health)

8 – Oct 22 No Class to be held - Individual appointment will be scheduled in the classroom with the Instructor and mid-point check in with your supervisor. All midpoint reviews should have been electronically submitted.

9 – Oct 29 Public Health in Practice II: An in-depth consideration of two current topics in health education: Lay Health Workers & Online Health Literacy

10 – Nov 5 Leadership vs. Management: "Getting from the dance floor to the balcony"

11 – Nov 12 Making Presentations and Resumes and professional development (Bring 2 hardcopies of your resume.)

12 – Nov 19 Organizational change (Reflection Paper # 3 - *due 11/18*: Leadership vs Management)

X – Nov 26 (No Class) College Closed – Thanksgiving Holiday

13 – Dec 3 Individual scheduled presentations of Internships, Posters (session I)

14 – Dec 10 Individual scheduled presentations of Internships, Posters (session II)
(Summary papers, final documents and revised Abstract - *due 12/9*)

15 – Dec 16 - 23 Final Exams Period

- September 2 - Last day to add a class
- September 17 - Course withdrawal period begins / November 7 – withdrawal period ends

HUNTER COLLEGE OF THE CITY UNIVERSITY OF NEW YORK
THE SCHOOLS OF THE HEALTH PROFESSIONS
HUNTER-BELLEVUE SCHOOL OF NURSING

Spring 2015

NURS 771 – COMMUNITY HEALTH NURSING 1
5 credits: 30 hours of theory, 15 hours of seminar and 166 hours of clinical
Tuesday 3:00PM - 3:50PM: Seminar
4:10PM - 5:50PM: Theory

Pre or co-requisites: NURS 700, NURS 702, and NURS 749

Faculty: **Judith Aponte, PhD, RN, CDE, CCM, APHN-BC**
Office: **Room 430**
Telephone: **(212) 481-7568**
Office hours: **Tuesday 3PM-5PM and by appointment**
E-mail: **jap@hunter.cuny.edu**

Course Description
Identification of skills for Advanced Public Health Nurses to conduct a health-related community needs assessment, participate on interdisciplinary teams in partnership with diverse consumers, and apply principles of Continuous Quality Improvement (CQI).

Expanded Description
Analysis of different models of public health, including core public health functions and standards of practice. Principles of cultural competence, social marketing, advocacy, and service-learning are applied to enhance the health of diverse communities. Health screening and counseling strategies are explored. Ethical/legal tensions between an individualist and public health perspective are examined. A global health perspective is applied.

Course Objectives
1. Apply concepts from nursing and public health to develop the practice role of Advanced Public Health Nurse.
2. Use an evidence-based community health assessment framework to collect, analyze, and evaluate findings.
3. Apply principles of cultural competence, service-learning, and evidence-based practice to promote the health and wellness of culturally diverse communities.
4. Use a variety of health communication and social marking strategies to develop sustainable programs that promote health of an identified community.
5. Apply the principles of Total Quality Management/Continuous Quality Improvement (TQM/CQI) in diverse community settings.
6. Analyze how public health and individualistic ethical/legal models impact on advocacy in working with diverse populations.
7. Apply a global perspective in identification of relevant community interventions.

Teaching Strategies
- Lecture/discussion
- Preceptored clinical placement
- Presentations
- Seminar discussions

Evaluation Methods

- Clinical Practicum-167 clinical hours documented via logs (Pass/Fail)
- Participation in on-line class and Seminar 15%
- Community Health Assessment Paper-Group assignment 30%
- Community Health Assessment Log 10%
- Population Assessment Presentation 20%
- Key Informant Interviews 25%

American Psychological Association. (2010). *Publication manual.* (6th ed.). Washington, DC: American Psychological Association. (ISBN-13-978-1-4338-0561-5)

Content Outline

Date	Lecture Topic	Seminar wk	Seminar Topic
02/03	- Introduction to the course: objectives and requirements - Overview of Community Health Nursing/Public health Nursing - Quad Council competencies - Core functions of public health	Week 1-group seminar	Introductions
02/10 Chapter 11	-Community-centered nursing practice: The individual, family, aggregate and community - Health and health disparities	Week 2	Assessment
02/17 Chapter 2	-Philosophy of health, community, community health, community health nursing -Philosophy of public health nursing and population	Week 3	Population Diagnosis and Priorities
02/24 lecture and seminar is on-line Chapter 7	-Caring for culturally diverse communities -Culturally competent community nursing care -Developing culturally competent interventions	Week 4-online	Article-Community/public health nursing: Is there a future for the specialty?
03/03 Chapter 11	-Conducting a community health assessment	Week 5	Outcomes Identification
03/10 Chapter 3 & 12	-Analyzing community health assessment data -Interpreting statistical and epidemiological data and measures	Week 6	Planning
03/17 Chapter 13 & 14	-Planning and implementing a community health Program	Week 7	Implementation
03/24	No class to exchange for attending the Forum	Week 8-0nline	Ethics case study
03/31 Chapter 1	-Global Health and Implications-guest speaker	Week 9	Evaluation
04/14 Chapter 8	-Healthy Public Policy-guest speaker	Week 10	Education/ Evidenced-based practice and research/Quality of practice
04/21	-Risk communication -Evidence-based practice	Week 11	Communication/Leadership/ Collaboration

04/28 Chapter 4	-Environmental health-Guest Speaker	Week 12	Professional Practice Evaluation/Resource Utilization
05/05 lecture and seminar is on-line	Online class	Week 13-online	Environmental Health case study
05/12 Chapter 5 & 6	-Public Health ethical principles -Social justice -Access to health care issues	Week 14	Advocacy
05/19	Presentations	Week 15	Continuation of Lecture Presentations

ATTENDANCE POLICY
Students are expected to attend class weekly. If they miss a class due to illness or unexpected circumstances, it is their responsibility to obtain information regarding missed content.

ACADEMIC INTEGRITY STATEMENT
"Hunter College regards acts of academic dishonesty (e.g., plagiarism, cheating on examinations, obtaining unfair advantage, and falsification of records and official documents) as serious offenses against the values of intellectual honesty. The College is committed to enforcing the CUNY Policy on Academic Integrity and will pursue cases of academic dishonesty according to the Hunter College Academic Integrity Procedures."

ACCOMMODATIONS FOR STUDENTS WITH DISABILITIES:
In compliance with the ADA and with Section 504 of the Rehabilitation Act, Hunter is committed to ensuring educational access and accommodations for all its registered students. Hunter College's students with disabilities and medical conditions are encouraged to register with the Office of AccessABILITY for assistance and accommodation. For information and appointment contact the Office of AccessABILITY located in Room E1214 [on the 68th St. campus] or call (212) 772-4857 /or VRS (646)755-3129.

POLICY ON STUDENT USE OF RECORDING DEVICES:
The student use of any video recording devices (including cameras) in any classroom, laboratory or clinical setting is strictly prohibited. (The only exception is when the use of such equipment is expressly authorized by the instructor as part of a class assignment or other assigned class activity). The student use of audio recording devices in any classroom or laboratory is allowed only with the permission of the faculty member, which may be granted or denied at the faculty member's discretion. Student use of audio recording devices in the clinical setting is allowed with the permission of the instructor only if it is consistent with facility policy.

This policy applies both to stand-alone video and audio recording devices and to use of video or audio recording functions on other devices, including but not limited to cell phones and PDAs.

Course Description

Identification of skills for Advanced Public Health Nurses to conduct a health-related needs assessment for a specific aggregate, analyzes community-based health-related policy, and builds sustainable coalitions with diverse partners.

Expanded Description

Healthy People 2020 objectives including the Action Model to Achieve Healthy People 2020 Overarching Goals are applied. Principles of risk communication with vulnerable populations are analyzed. Health screening programs including internet-based interventions are evaluated. Unique issues related to immigrant health are explored. Role development of Advanced Public Health Nurses is examined including application of technology.

Course Objectives

1. Use the Healthy People 2020 model to assess the health-related needs of a specific aggregate, identify a priority need, and begin to develop a program to address that need.
2. Analyze how health policies impact on diverse aggregates and communities.
3. Work with relevant coalitions to ensure implementation of ethical and legal health-related policies in diverse communities.
4. Apply principles of risk reduction when working with diverse aggregates and communities to increase knowledge and skills to promote self-care and healthy behaviors.
5. Analyze the effectiveness of different health screening interventions in diverse communities.

6. Evaluate the health status of immigrant communities through a global/local perspective.
7. Evaluate how technology impacts on the health status of diverse communities.

Teaching Strategies

- Lecture/Discussion
- Blackboard Assignments
- Audio-visuals (Powerpoint)
- On-line Exercises
- Written Assignments

Method of Evaluation:

- Aggregate Health Promotion Intervention Assignment (20%) maximum 6 pages
- Partnership Assignment (20%) maximum 6 pages
- Program Development and Evaluation Assignment (20%) maximum 5 pages
- Program Development and Evaluation Presentation (15%)
- Blackboard assignment (20%)
- Scholarly participation (5%)

Content	
Week	Content Description
Week 1 (09/01/15)	• Introduction, review of course description and assignments • Core Functions of Public Health • Aggregate assessment • Identification of need/gap using population and aggregate epidemiological data
Week 2 (09/08/15)	• **GUEST SPEAKER** New York City Emergency Management & Preparedness
09/15/15 & 09/22/15	**NO CLASS**
Week 3 (09/25/15) FRIDAY FOLLOWING A TUESDAY SCHEDULE On-line lecture and seminar	• Program development to address need/gap • Integrating health education principles • Educational models
Week 4 (09/29/15)	• Principles of coalition building • Strategies for coalition-building • Types of coalitions • Identification of coalitions related to aggregate need
Week 5 (10/06/15) Assignment Due	• Interventions • Effectiveness of specific health screening programs • Using technologies such as text messaging, internet
Week 6 (10/13/15) On-line lecture and seminar	• CQI
Week 7 (10/20/15)	• Coalition building & Policy Change

Week 8 (10/27/15) Assignment Due	• Policy analysis • When and who developed the policy? • Are there historical issues related to the policy? • Who were the stakeholders when the policy was implemented?
Week 9 (11/03/15)	• Program development, implementation and evaluation • Policy and advocacy
Week 10 (11/10/15) On-line lecture and seminar	• Ethics/Policy
Week 11 (11/17/15)	**No class in exchange to attending Spring Forum lecture**
Week 12 (11/24/15) On-line lecture and seminar Logic model	• Quality Improvement
Week 13 (12/01/15) Assignment Due	• Evaluation of Health Promotion Program
Week 14 (12/08/15)	• Evaluation of Health Promotion Program (continued)
Week 15 (12/15/15)	• Presentations

Method of Evaluation

1. Practicum Experience: (167 hours total) Pass/Fail. A grade of Pass is required in order to receive a grade in Nurs 772. Use TYPHON to submit weekly clinical log according to required template for agency and non- agency learning experiences. Submit weekly log in a complete and timely fashion. Document completed 167 clinical hours. Non-agency clinical hours require prior approval by Seminar Instructor and are not to exceed 25 hours of the 167 total.

2. Aggregate Health Promotion Intervention Assignment (20%): Due date 10/06

For this assignment, you will describe two (2) realistic health interventions you would be able to implement, which addresses a person/people with a specific health issue identified from your aggregate. The interventions should be directed towards people with a specific illness, a detailed description on how the health care system/services (i.e. access to care, health insurance) support the affected people. To prepare for this assignment, you will need to find at least 5 articles from a peer-reviewed journal to use for this assignment. These articles should describe current health interventions about your selected aggregate. These sources can help you to get a better understanding of your aggregate, identify shortcomings of current health interventions, and learn about effective intervention strategies for your aggregate. For this paper, you will need to compare and contrast at least 2 existing interventions identified from the literature, and then explain why you chose these two interventions and how they are appropriate for your aggregate (e.g., people with HIV), and how you would adapt these two interventions for your aggregate.

The aggregate paper only requires for you to discuss 2 interventions, NOT 4. The 2 interventions should be evidenced-based from the literature and should be tailored to your specific aggregate. Detail should be provided explaining how it was tailored and the specifics of the intervention itself.

Submit **no more than 6 pages,** typed, double-spaced using APA style. References should be evidenced based published articles, not older than 5 years old. Use heading in your paper.

Grading

- Identifies and describes the aggregate (2%)
- Clearly explains and describes at least three (3) needs of the aggregate (e.g., more programs on prevention and cessation of cigarette smoking) (3%)
- Describes and identifies at least three (3) risk factors of the aggregate (e.g., if aggregate is people with HIV than a possible risk factor would be using IV drugs) (3%)
- Identifies two (2) health interventions for the aggregate (2%)
- Clearly describes how the intervention would be adapted and provides the rationale for adapting such interventions for the aggregate (5%)
- Grammar, spelling, punctuation, organization, clarity (i.e., ideas are concrete and comprehensive) and APA format (5%)

If the assignment is late, 5 point will be deducted the first day it is late and 1 point thereafter each day the assignment is overdue, starting the day after the original due date.

3. Partnership assignment-Total 20%: Due date 10/27
Submit **no more than 6 pages,** typed, double-spaced using APA style. References should be evidenced based published articles, not older than 5 years old. Use heading in your paper.

Grading:
- Identify at least 5 partners you would work with to improve the health status of your aggregate. Include address and description of the partner (e.g., facility/community based organization) and overall services they provide (2.5%)
- Explain how these partners are important and appropriate to work with, for your aggregate. What is the aim of collaborating with this partner? (5%)
- What programs, specific to your aggregate, currently exist at these partnerships you would collaborate with? Explain the programs in detail (e.g., age group it services, description of the program itself) (5%)
- Describe and explain what would be your role as a partner and what your contribution would be? (5%)
- Grammar, spelling, punctuation, organization, clarity (i.e., ideas are concrete and comprehensive) and APA format (2.5%)

If the assignment is late, 5 point will be deducted the first day it is late and 1 point thereafter each day the assignment is overdue, starting the day after the original due date.

4. Program Development & Evaluation Assignment (20%): Due date 12/01
Based on the two (2) interventions identified in the "Aggregate Health Promotion Intervention Assignment" directed towards your aggregate (i.e., people with a specific illness) use both interventions and develop one (1) program that can be utilized in a specific setting (e.g., schools, community mental health organizations, academic department).
Submit **no more than 5 pages.** Five (5) pages maximum for the program. Assignment must be typed, double-spaced using APA style. References should be evidenced based published articles, not older than 5 years old. Use heading in your paper.

Grading:
1. Identify the two (2) interventions for the aggregate (1%)
2. Write your own vision statement, mission statement, and philosophy statement of the program you develop (3%)
3. Identify in detail at least three (3) goals of the program you develop (2%)
4. Identify in detail at least three (3) objectives of the program you develop (2%)
5. Identify staff needed for the program. Provide rationale of each staff member and role for each. (4%)
6. Explain methods you would use to evaluate your program (4%)
   Grammar, spelling, punctuation, organization, clarity (i.e., ideas are concrete and comprehensive) and APA format (4%)

If the assignment is late, 5 point will be deducted the first day it is late and 1 point thereafter each day the assignment is overdue, starting the day after the original due date.

5. Program Development and Evaluation Presentation (15%): Due date 12/15
- **PowerPoint submitted electronically to your individual Blackboard folder by 12/13**
  Limit presentation to maximum of 7 slides, excluding title slide which includes your name and credentials and references. Use APA format to cite sources throughout the presentation.
- **Presentation of key findings 12/16–last day of class**
  Presentation of highlights of Program Development and Evaluation Assignment - frame your comments from the perspective of delivering your program and evaluation key findings to Administrators of the agency. Assume that the Administrators have reviewed your PowerPoint. Presentation is between 6-7 minutes maximum, includes Q & A.

6. Scholarly contributions during lecture and seminar discussions (5%)
Complete assigned readings/resources; participate in discussions, integrating readings/resources and clinical experiences; offer constructive support to fellow students and class/seminar dynamics; and analyze and interpret topics under consideration and share learning.

7. Blackboard assignment (20%): Due dates 9/25, 10/13, 11/10 and 11/24
On-line Blackboard assignments will be available the Monday of the seminar and will be due by Sunday of that week. For example, on-line assignment of 10/13 will be available to you on 10/12 and will be due on 10/18.

a. Use the template provided to complete the Logistic assignment. Post onto Blackboard into the folder allocated for the assignment (Logistic assignment 5%). Please see rubric for grading. If the posting is submitted after the due date and time, you will earn a zero (0) for the assignment. You need to post your responses by 11:59pm on the due date of the assignment. If you need help with Blackboard, please call Student HelpDesk at 212.650.3624
b. Bb assignment (5%)
c. Bb assignment (5%)
d. Bb assignment (5%)

Rubric for Logic Model Blackboard Assignment

	Yes	No	N/A	Total Points
Description of the problem and subproblem is understandable, clear and concise.				1
Activities are clear and appropriate to address the problem and subproblem(s) identified.				1
Output measures are clear are appropriate and related to the activities.				2
Short-term and long-term measures are understandable, appropriate for the output measures and addresses the problem and subproblem.				1

Clinical Attire:
Students are expected to dress appropriately (professionally and according to the agency's standards) during clinical. Acceptable attire does NOT include jeans. Remember you are representing Hunter-Bellevue School of Nursing at the clinical site.

Attendance Policy:
Students are expected to attend class weekly. If they miss a class due to illness or unexpected circumstances, it is their responsibility to obtain information regarding missed content.

Communication:
Any changes in the class schedule, additional information about assignments, etc., will be posted on Blackboard. In general, announcement will be posted on Blackboard to alert students as well as sent via e-mail. Please check Blackboard and Hunter e-mail regularly.

ACADEMIC INTEGRITY:
Hunter College regards acts of academic dishonesty (e.g., plagiarism, cheating on examinations, obtaining unfair advantage, and falsification of records and official documents) as serious offenses against the values of intellectual honesty. The College is committed to enforcing the CUNY Policy on

Academic Integrity and will pursue cases of academic dishonesty according to the Hunter College Academic Integrity Procedures. The full policy can be accessed at the Hunter College Senate website: http://www.hunter.cuny.edu/senate[1].

STUDENT SERVICES, OFFICE OF AccessABILITY:

In compliance with the Americans with Disabilities Act of 1990 (ADA) and with Section 504 of the Rehabilitation Act of 1973, Hunter College is committed to ensuring education parity and accommodations for all students with documented disabilities and/or medical conditions. It is recommended that all students with documented disabilities (emotional, medical, physical and/or learning) consult the Office of AccessABILITY located in Room E1124 [on the 68th Street campus] to secure necessary academic accommodations. For further information and assistance please call 212-772-4857 (TTY 212-650-3230).

POLICY ON STUDENT USE OF RECORDING DEVICES:

The student use of any video recording devices (including cameras) in any classroom, laboratory or clinical setting is strictly prohibited. (The only exception is when the use of such equipment is expressly authorized by the instructor as part of a class assignment or other assigned class activity). The student use of audio recording devices in any classroom or laboratory is allowed only with the permission of the faculty member, which may be granted or denied at the faculty member's discretion. Student use of audio recording devices in the clinical setting is allowed with the permission of the instructor only if it is consistent with facility policy.

This policy applies both to stand-alone video and audio recording devices and to use of video or audio recording functions on other devices, including but not limited to cell phones and PDAs.

The policy can be accessed at: http://www.hunter.cuny.edu/studentservices/advising/policies-sub/policies-academic-integrity

Revised 09/09/15 ja

CUNY SCHOOL OF PUBLIC HEALTH

COURSE SYLLABUS

Hunter College
PH 73700: Supervised Fieldwork in Public Health
3 Credits
Fall 2015

Time and location	Mondays 8:00pm-9:45pm // Silberman, room 201 See **Schedule** below for details.	
Instructors	**Contact info**	**Office hours and location**
Janice Chisholm (HPM)	jc2898@columbia.edu	By appointment
Jennifer Brite (EPI/BIOS)	jenbrite@gmail.com	By appointment
Daliah Heller (COMHE)	daliah.heller@sph.cuny.edu	By appointment 55 West 125th St, rm 808
Brian Pavilonis (EOHS)	bp305@hunter.cuny.edu	By appointment Silberman, rm 721
Arlene Spark (NUTR)	aspark@hunter.cuny.edu	By appointment Silberman, rm 609
Course website	https://bbhosted.cuny.edu	
Support resources	For technical assistance, contact the Helpdesk. Academic support services and writing skills assistance are available.	
Course description	Students carry out 180 hours of supervised field work that is intended to bridge academic preparation and public health practice. Knowledge and skills from the core MPH and specialization courses are applied in a public health agency, community organization or other setting relevant to the student's academic background, specialization and career expectations. This is accomplished under the supervision and guidance of an experienced preceptor. Field-	

	based hours are implemented with classroom and individual meetings along with online communication. Aside from deliverables required by the preceptor, the student develops a reflection paper, a self-evaluation and a capstone proposal.
Course prerequisites	Completion of 18 credits toward the master's degree, including at least 3 required core courses (biostatistics, epidemiology, and the course most relevant to your specialization) and at least 2 courses in student's specialization.
Course format	The course is provided in a hybrid format – didactic sessions are provided online, including confirmatory participation quizzes, and face-to-face sessions are held for group meetings with faculty advisors and peers. Please see Schedule below for details.

Core Competencies	Course Learning Objectives	Assessment Methods
This course will help you to:	*After successfully completing this course, you are expected to be able to:*	*Competencies and learning objectives will be assessed as part of the following course assignments:*
Apply the public health core functions of assessment, policy development and assurance	• Demonstrate (e.g. through the portfolio) the application of assessment, assurance and/or policy development during the fieldwork experience.	• Identify and assemble in the e-portfolio the product(s) of fieldwork project that exemplify the application of core public health functions in your work
Apply theories, concepts, models and methods to the design of public health research, policy and practice	• Demonstrate through self-reflection activities the application of one or more core public health values or techniques through the fieldwork experience	• Submit a "Reflections" paper on the fieldwork project and your perspective on public health practice
Adhere to ethical and social justice principles and standards	• Apply ethical principles to fieldwork placement, (e.g. human subjects' protection principles to the data collection). • Assess the degree to which the fieldwork placement agency adheres to ethical principles and standards	• Establish an approved protocol through CUNY IRB for human subjects' protection in your fieldwork project • Complete and submit the Student's Evaluation of Fieldwork Project Form
Interpret and analyze public health literature and apply evidence-based research	• Explore and become familiar with the public health literature databases and resources for organizing citations and sources	• Submit a rapid literature scan on your fieldwork topic

		• Submit a working bibliography on your fieldwork topic • Submit a literature review on your Capstone research question
Apply basic statistical and informatics techniques	• Review and identify appropriate quantitative methods and tools for measuring public health data	• OPTIONAL (Quantitative Studies Only). In your Capstone Proposal, describe the method(s) you've selected for measuring your data from the fieldwork project
Communicate public health information through oral, written, digital and visual presentation	• Prepare written and oral progress and evaluation reports (e.g. the fieldwork project), using appropriate professional formats.	• Submit via electronic forms two progress reports on the fieldwork placement project • Complete and submit the Student's Evaluation of Fieldwork Project Form
Explain how social, behavioral, biomedical and environmental determinants affect population health	• Discuss the relationship between social, behavioral, biomedical, and environmental elements and health outcomes	• Submit a "Reflections" paper on the fieldwork project and your perspective on public health practice
Design and evaluate interventions to prevent or control public health problems	• Develop and assess policies and activities that are responsive to public health problems	•

Collect, analyze and interpret public health data	• Apply data collection, analysis, and interpretation methods to public health data	• OPTIONAL (Quantitative Studies Only). In your Capstone Proposal, describe the method(s) you've selected for measuring your data from the fieldwork project
Engage and collaborate with diverse groups	• Identify different stakeholders and evaluate their roles on the fieldwork project.	• Complete and submit the Student's Evaluation of Fieldwork Project Form
Describe the legal foundations of the U.S. public health system and its interrelationships with other systems including health care, education and environmental protection	• Discuss the legal aspects of the US public health system and its inter-sectoral relationships with other public systems.	• Submit a "Reflections" paper on the fieldwork project and your perspective on public health practice
Apply a framework for the planning, implementation and evaluation of public health programs, policies and interventions	• Explain the difference between key planning constructs and demonstrate the ability to incorporate them in planning, implementing and evaluating the fieldwork project	• Complete and submit a Gantt chart describing the timeline for the fieldwork project • Design and submit a logic model describing the process for the research conducted via the fieldwork project
Explain the context of public and private health-care systems in which health care and public health policy are made and healthcare is delivered	• Discuss how the agencies you worked with during your fieldwork experience deliver health-related services to the populations they serve.	• Submit a "Reflections" paper on the fieldwork project and your perspective on public health practice

Course Assessments

The Supervised Fieldwork course is designed to guide students through the development, implementation, and completion of a research project on some aspect of public health practice at an approved placement site. Course assignments reflect the progressive activities involved in conducting the project, including design, planning and management, and implementation. This course process is intended to support the student's progress in the fieldwork project and to generate the elements of a resulting Capstone proposal or template paper for the student's culminating experience in the degree program. During the fieldwork period, students are expected to complete and submit two progress reports, and a final "reflections" paper on the experience. Both students and preceptors are required to complete evaluations of the fieldwork project upon its completion.

Grading

Evaluation criteria

Assignments and their relative weight toward your final grade in the course are listed below. The evaluation rubric which will be used to establish the grade for each assignment is available on the course Blackboard website under the section entitled My Assignments, along with instructions for that assignment. Items prefaced with an asterisk (*) will not have an evaluation rubric, and will be graded simply as complete (full points) or missing/incomplete (no points).

The relative weight of each course component is as follows:

Assessment	Weight
Rapid literature scan	10%
Working bibliography	5%
*IRB determination	5%
*Progress report #1	5%
Gantt chart	5%
Logic model	5%
*Progress report #2	5%
Literature review	15%
"Reflections" paper on fieldwork project	15%
Capstone proposal	20%
Class participation	10%
*Student Evaluation of Fieldwork Project Form	%
*Preceptor Evaluation of Fieldwork Project Form	%
	100%

The grading system for the course follows guidance in the Hunter Catalog.

Letter Grade	Quality Points	Percentage
A+	4.0	97.5 - 100
A	4.0	92.5 - 97.4
A-	3.7	90.0 - 92.4
B+	3.3	87.5 - 89.9
B	3.0	82.5 - 87.4
B-	2.7	80.0 - 82.4
C+	2.3	77.5 - 79.9
C	2.0	70.0 - 77.4
F	0	<70

The final course grade will be determined using the performance assessment described above, and resulting in a Pass (70% or higher) or a Fail (less than 70%) grade.

Withdrawal

If an emergency arises, the student must immediately notify the instructor and agree upon a course of action, especially if the student is unable to complete the course. Students are permitted to officially withdraw from courses without academic penalty generally up until the 10th week of class. The specific policies and dates for withdrawal are available online. Only the student (not the instructor or staff) may officially withdraw from a course. Failure to officially withdraw may result in an "unofficial withdrawal" (WU), which is equivalent to a grade of F, or 0 averaged into your GPA.

Grade of incomplete

Incomplete final grades will not be granted unless the request is justified by legitimate and documented emergencies. The granting of an incomplete grade is at the discretion of the instructor; there is no absolute right to a grade of incomplete. In the case that an incomplete grade is granted, the student must negotiate and prepare a signed contract with the instructor specifying the terms and timeline for completion of all outstanding work. Refer to the Hunter Catalog for further details.

While the program discourages students from taking Incompletes, under some circumstances, an Incomplete may be the only option for completing the Fieldwork Project.

A request for an Incomplete must be approved by the Faculty Advisor, and the incomplete grade must be resolved within the next two semesters.

Students with an Incomplete in this course, Fieldwork (PH 73700), are not eligible for enrollment into the Capstone course (PH 73800) until the Incomplete is resolved.

Grade appeals

When a student considers a final course grade unsatisfactory, the student should first confer with the instructor within the first three weeks of the following semester. If the student is still not satisfied, the student should promptly contact the Campus Director in writing giving the factual reasons and basis for the complaint. This appeal must be submitted within the first five weeks of the semester following receipt of the grade. For further guidance, refer to the Hunter Catalog.

Course Policies

Attendance and class participation

Because this is a hybrid course, students are expected to participate both online and in face-to-face meetings in class. Online participation is limited to two didactic sessions, and will be assessed with mini-quizzes to be completed at the end of each module in the session. Face-to-face participation will be assessed by faculty-administered attendance at the six class meetings.

Late/incomplete submission of assignments

Late assignments will not be accepted except in extenuating circumstances, with written approval by the student's faculty advisor. Incomplete assignments will be graded as such, unless the student is granted the opportunity to submit a rewrite by the faculty advisor, with written approval.

Make-ups, rewrites, and extra credit

Make-ups and extra credit assignments are not available for this course. In extenuating circumstances, the faculty advisor may allow a rewrite (or resubmission) of an Incomplete assignment, and must agree to this arrangement with written approval.

Expectations of students

Students are expected to submit Assignments on time, to participate respectfully in class and on the course Blackboard website, and to communicate with their Faculty Advisor on progress and problems related to the Fieldwork Project, as soon as issues arise.

Expectations for the instructor

Faculty Advisors will grade Assignments and post results within seven days of submission. Faculty Advisors will respond to all emails from students within 72 hours of receipt, and will arrange face-to-face meetings with students as requested, and with Preceptors, as necessary.

Accessibility

Support services and accommodations are available to provide students with disabilities greater accessibility to the academic environment. Those eligible include students with mobility, visual and hearing impairments. It also includes students with learning disabilities, psychiatric disorders or any medical condition that limits one or more of life's basic functions. Please let the instructor know at the beginning of the semester if a student has special accommodations that are necessary for class sessions, exams or presentations. The Office of AccessABILITY for Hunter College is located in Room 1214B, East Building, 695 Park Avenue, New York, NY 10065, email: AccessABILITY@hunter.cuny.edu, phone: (212) 772-4857.

Academic integrity

Hunter College regards acts of academic dishonesty (e.g. plagiarism, cheating on exams, obtaining unfair advantage, and falsification of records and official documents) as serious offenses against the values of intellectual honesty. The College is committed to enforcing the CUNY Policy on Academic Integrity and will pursue cases of academic dishonesty according to the Hunter College Academic Integrity Procedures. Refer to the CUNY Policy on Academic Integrity and other sources for definitions and examples of academic dishonesty.

Course Schedule

This course schedule is subject to change.

For important dates, please refer to the current academic calendar.

Session # Mode Date	Topic	Assignment (Please submit all Assignments to your Faculty Advisor via email and via the Assignments section on the course Blackboard site.)
Session 1. **Face-to-face** August 31	Welcome and overview, Fieldwork connection to Capstone • Searching the literature: Initial Lit Scan • Developing a research question • IRB preparation and submission	By 8/31 • A fieldwork contract (Please bring your contract to class)
Session 2. **Face-to-face** September 10	Library session • Search tools • Reference management tools	**Meet in C Level at Silberman Room TBD**
Session 3. **Face-to-face** October 5	Meet in track-specific groups in class • Discuss research question and literature review development	By 10/4 • An IRB determination form (Please bring your completed form to class) • A brief literature scan • First midterm fieldwork status assessment survey

Session # Mode Date	Topic	Assignment (Please submit all Assignments to your Faculty Advisor via email and via the Assignments section on the course Blackboard site.)
Session 4. **Online** October 19 – October 25	• Project Management using Gantt Charts • Logic Models • Charts, Graphs and Figures for Projects	
Session 5. **Face-to-face** October 26	Meet in mixed (non-track-specific) groups in class • Discuss project management planning, processes, and implementation	By 10/25 • A project plan using a Gantt chart or similar timeline model • Project logic model (Please bring both documents to class)
Session 6. **Online** November 9 – November 15	Complete two out of three sections, most relevant to your Fieldwork Project - 1. Complete one of a) Quantitative Analysis – planning and preparation: data analysis and mini stats review b) Qualitative Studies – planning and analysis *2.* Capstone paper – planning and development	By 11/9 • Second midterm fieldwork status assessment survey • Preliminary working bibliography • Literature review
Session 7. **Face-to-face** November 16	Meet in track-specific groups in class • Peer review and discuss each other's Capstone paper proposals	By 11/15 • First draft of Capstone proposal (Please bring your first draft to class)

Session # Mode Date	**Topic**	**Assignment** **(Please submit all Assignments to your Faculty Advisor <u>via email and via the Assignments section on the course Blackboard site</u>.)**
Session 8. **Face-to-face** December 14	All-class meeting to review Fieldwork to Capstone requirements • Track-specific group meetings to finalize Fieldwork to Capstone processes	By 12/13 • A completed **Student's Evaluation of Fieldwork Experience Form** • A completed **Field Placement Supervisor's Evaluation Form (emailed from Placement Supervisor to Fieldwork faculty)** • A 'Reflections' document on Fieldwork for Student Portfolio • Capstone Proposal • Working bibliography
Optional. **Individual consultations** December 15-21	Student Faculty Consultations	**Note: Students should verify that all Assignments have been delivered or scheduled for delivery with Fieldwork faculty.**

Fall 2015

Time and location	Mondays, 6-8:40pm Lehman College, location TBA
Instructor	Emma K. Tsui, PhD, MPH emma.tsui@lehman.cuny.edu (preferred mode of communication) 347-577-4038 Gillet Hall, Room 422D
Office hours	Mondays 4:30-5:30pm and Thursdays 3:30-5:30pm (walk-in) and other times by appointment
Course website	https://bbhosted.cuny.edu
Support resources	For technical assistance, contact the Helpdesk. Academic support services and writing skills assistance are available. Lehman's Academic Center for Excellence (ACE) provides appointment-based and drop-in tutoring and general writing and academic skills workshops. To obtain more information about the ACE, please visit http://www.lehman.edu/issp or call the ACE at 718-960-8175.
Course description	Examination of historical development and philosophical concepts underlying the practice of public health; social, political, and institutional forces shaping public health policy and the commitment to monitor, protect, and promote the public's health; emphasis on the relationship between public health knowledge, values, and actions.
Course prerequisites	N/A
Course format	In-person lecture and discussion-based sessions
Required reading and resources	Hives of Sickness: Public Health and Epidemics in New York City. Edited by David Rosner (New Brunswick, N.J.: Rutgers University Press, 1995). Price: $30.29, Amazon Available on reserve at the Leonard Lief Library Institute of Medicine. The Future of the Public's Health in the 21st Century. Free download at: http://www.iom.edu/Reports/2002/The-Future-of-the-Publics-Health-in-the-21st-Century.aspx Other articles as assigned under "Schedule".
Suggested reading and resources	See listing under "Schedule"

Core Competencies	Course Learning Objectives	Assessment Methods
This course will help you to:	*After successfully completing this course, you are expected to be able to:*	*Competencies and learning objectives will be assessed as part of the following course assignments:*
Communicate public health information through oral, written, digital and visual presentation	• Summarize a peer-reviewed journal article • Synthesize peer-reviewed journal articles on a specific topic • Trace and discuss the historical development, themes and ongoing controversies in the field of public health	All assessment methods
Collect, analyze and interpret public health data	• Use electronic databases to gather public health information	Journal article summaries, annotated bibliography, and synthesis paper
Interpret and analyze public health literature and apply evidence-based research	• Summarize a peer-reviewed journal article • Synthesize peer-reviewed journal articles on a specific topic	Journal article summaries, annotated bibliography, and synthesis paper

Program Competencies	Course Learning Objectives	Assessment Methods
This course will help you to:	*After successfully completing this course, you are expected to be able to:*	*Competencies and learning objectives will be assessed as part of the following course assignments:*

Analyze critical health inequalities confronting urban populations by social and economic determinants such as race, ethnicity, income and neighborhood	• Trace and discuss the historical development, themes and ongoing controversies in the field of public health	Participation in class discussions
Identify aspects of public health ethics and values of social justice that affect public health practice and decision-making	• Define, understand and discuss the philosophical orientation of public health • Trace and discuss the historical development, themes and ongoing controversies in the field of public health	Participation in class discussions, presentation on a historical figure
Synthesize theories, methods and practice of public health to address income inequities within communities	• Trace and discuss the historical development, themes and ongoing controversies in the field of public health	Participation in class discussions, synthesis paper

Course Assessments
The following assignments are meant to give you a chance to practice and develop expertise in skills that are fundamental to the forms of public health research and writing that you will be doing throughout the MPH program. These include: 1) understanding and summarizing the key points of public health journal articles, 2) searching the public health literature to find articles on a given topic, and 3) synthesizing what you've learned from those articles. These are critical skills for succeeding in the program and as a public health professional. We have designed these assignments to be clear, manageable, and short. This means we expect that all of your work will be thoughtful and of the highest quality.

Journal Article Summaries (2)
You will practice reading an assigned journal article, summarizing and writing up its key points, using the guidelines and practices discussed in class. You will receive feedback from your first journal article summary and you are expected to put this feedback to use when writing your second journal article summary.

Annotated Bibliography
For this assignment, you will conduct a search of the literature on one of three topics. You will receive guidance from our health sciences librarian on how to effectively search the scientific literature. Using the articles you find that are most closely related to your topic, you will construct an annotated bibliography of at least 6 articles. This is an extremely small bibliography and the goal is to choose high-quality, well-targeted articles that can be synthesized into a short paper on your chosen topic.

Synthesis Paper
In a paper of 400-800 words, **synthesize** what you learned about your topic. Doing well on this assignment requires that you integrate findings from all of your sources and that you do not merely report findings of different studies sequentially. If you find that any articles from your bibliography cannot be synthesized comfortably into your paper, then you can replace them with more suitable articles.

Presentation on a PH historical figure/topic
You will give a presentation of 5-10 minutes on a public health historical figure/topic, using the rubric presented in class for guidance.

Grading
Evaluation criteria
Grading rubrics will be provided via the course website for course assignments.

The relative weight of each course component is as follows:

Assessment	Weight
Participation in class discussions/attendance	15%
Journal Article Summaries (2)	25%

Annotated Bibliography	25%
Synthesis Paper	25%
Presentation on a PH historical figure	10%
	100%

The grading system for the course follows guidance given by the Lehman College Department of Health Sciences:

Letter Grade	Points
A	93-100%
A-	90-92%
B+	87-89%
B	83-86%
B-	80-82%
C+	77-79%
C	73-76%
C-	70-72%
F	< 70%

Withdrawal

The grade of W (withdrawal without penalty) is assigned only when a graduate student *officially* withdraws from a course. Students must complete the withdrawal process themselves, since the procedure requires a signature. No faculty member or program adviser can withdraw a student from a course. When students withdraw without completing the withdrawal procedure, the grade of WU is assigned for the course. This grade counts as a failure in computing the cumulative Grade Point Average. Graduate students should refer to the Graduate Bulletin and academic calendar for more information.

Grade of incomplete

The grade of INC (incomplete coursework) is awarded only when the course requirement has not been completed for good and sufficient reasons and when there is a reasonable expectation that the student can successfully complete the requirements of the course. For an instructor to grant an INC, the student must have met the instructor's attendance requirements in the course and have a passing semester average. An INC grade that has not been made up will change to a FIN grade (failure to complete coursework), remains permanently on the record, and counts as an F in computing the Grade Point Average. Refer to the Graduate Bulletin for further details.

Grade appeals

When a student considers a final course grade unsatisfactory, the student should first confer with the instructor. If the student is still not satisfied, the student should promptly contact the Program Director in writing giving the factual reasons and basis for the complaint. A student who wishes to appeal a grade must initiate the process in the full

semester following the one in which the contested grade was received. For further guidance, refer to the Graduate Bulletin.

Course Policies

Attendance and class participation

All members of the class are expected to actively participate in class lectures, activities, and discussions, and to complete assigned reading **and other assigned activities** prior to class. Attendance means more than just showing up; it means doing the reading and, more importantly, actively engaging with the ideas and issues brought up in the reading and in class. Your comments, questions and opinions are essential ingredients for making this course a challenging and rewarding experience for your classmates as well as for yourself, and it is expected that you come prepared to make this contribution. If you are going to be late or have to miss a class, please contact me via email as far in advance as possible. Points may be deducted for absences, tardiness, or leaving class early.

Late/incomplete submission of assignments

I expect that all assignments that are not to be completed in class will be submitted to me via email or Blackboard by midnight on the due date (usually the night before a class session). Assignments submitted after the due date will have half a letter grade deducted for each day that the assignment is late, except in cases of significant medical issues or other serious situations.

Make-ups, rewrites, and extra credit

Make-up assignments will not be allowed in this course, nor will rewrites. Extra credit assignments may be made available to students as opportunities during the semester present themselves.

Expectations of students

I expect the classroom to serve as a space of respect and collaborative learning and that the course assignments will help you to develop specific skills. To that end, I expect that:

- you will arrive on time and stay for the entire class
- you will not use cell phones during class, except during breaks
- you will visit our Blackboard site frequently, as that will be our primary way of communicating with one another outside of class. Class announcements and supplemental materials will be posted there frequently. Course announcements will also be sent out using the Lehman e-mail system. If you have any questions about your Lehman email address or your password, or if you have any problems accessing the site, please call the computer helpdesk at 718-960-1111.
- your writing for assignments will be of high quality, presented in a readable and consistent manner: double-spaced, typewritten, with one-inch margins all around, and **proofread**.

Expectations for the instructor

- Provide regular announcements, reminders, and suggestions on the course website
- Monitor, ask follow-up questions, and answer questions presented during in-class discussions
- Respond to student email within 24 hours Monday through Friday.
- Grading and feedback on assignments within 2 weeks of the due date.

Accessibility

Lehman College is committed to providing access to all programs and curricula to all students. Students with disabilities who may need classroom accommodations are encouraged to register with the Office of Student Disability Services. For more information, please contact the Office of Student Disability Services, Shuster Hall, Room 238, at 718-960-8441.

Academic integrity

The faculty and administration of Lehman College support an environment free from cheating and plagiarism. Each student is responsible for being aware of what constitutes cheating and plagiarism and for avoiding both. The complete text of the CUNY Policy on Academic Integrity and the Lehman College procedure for implementing the policy can be found in the Graduate Bulletin.

Course Schedule

Please note that the schedule and assignments listed below are subject to change. Additional readings and handouts may be provided, and session topics and activities may be altered if necessary. Opportunities for group/individual work may be scheduled during some sessions. All readings that are not part of the required text will be available via Blackboard. For important dates (e.g., course drop and withdrawal), please refer to Lehman's graduate academic calendar: http://www.lehman.edu/registrar/calendars.php.

	Date	**Topic**	**Readings and Assignments** (Required unless labeled "recommended")
1	8/31	Introduction to the course	• P.H.101: Chap. 1 Public Health: The Population Health Approach • 10 Public Health Achievements, United States, 1900-1999 • 10 Public Health Achievements, United States, 2000-2010 *Recommended* • Glass, et al. "Causal Inference in Public Health," Annu. Rev. Public Health (2013). 34:61-75.
	9/7	**No class (Labor Day)**	

2	9/10	Health equity & inequity	• IOM Report: Chap. 1 pp. 19-45 • Phelan, J. Link, B, and Tehranifar, P. "Social Conditions as Fundamental Causes of Health Inequalities: Theory, Evidence, & Policy Implications," Journal of Health and Social Behavior (2010): 41S S28-S40. *Recommended* • Raphael, Dennis. "Public policies & the problematic USA population health profile". Health Policy. 84 (2007): 101-111. • Marmot, M.G. "Inequalities in Health," New England Journal of Medicine (12 July 2001): 134-136.
	9/14	**No class**	
3	9/21	Changing patterns of health and illness (*1918 Influenza* video)	• Rothstein, William G. "Trends in Mortality in the Twentieth Century," reprinted in Lee and Estes, The Nation's Health, 7th ed. pp. 11-30. • "Achievements in Public Health, 1900-1999: Control of Infectious Diseases," Lee and Estes, The Nation's Health, 7th ed. pp. 31-37. *Recommended* • Schroeder, SA. "We can do better – improving the health of the American people." NEJM. 2007; 35: 1221-8. (Blackboard) **Journal article summary #1 due by midnight on September 20th**
4	9/28	How to search for articles	Meet in Library Lobby **Complete online library assignment**
5	10/5	Location as a social determinant of health I: Urban health then and now	• IOM Report: Chap. 2, pp. 46-95 • Hives of Sickness: Intro pp.1-21: and Condran, "Changing Patterns of Epidemic Disease in New York City", pp. 27-41
	10/12	**No class (Columbus Day)**	
6	10/19	Responding to epidemics (*Typhoid Mary* video)	• Hives: Leavitt, "Be Safe. Be Sure" New York City's Experience with Epidemic Smallpox", pp. 93-114. • Hives: Rogers, "A Disease of Cleanliness:

			Polio in New York City, 1900-1990", pp. 115-130. **Journal article summary #2 due by midnight on October 18th**
7	10/26	Whose view matters? Community perspectives on public health problems	• IOM Report, Chap. 4, pp. 178-211 • Barbara Israel et.al. "Review of Community-based Research: Assessing Partnership Approaches to Improve Public Health", Annual Review of Public Health, 1998, 19(1):173-203.
8	11/2	Race as a social determinant of health: The Case of Tuskegee (*Deadly Deception* film)	• Allan Brandt, "Racism and Research: The Case of the Tuskegee Syphilis Study: The Hastings Center Report, Dec. 1978, 8(6):21-29. • Hives: Kraut, "Plagues and Prejudice: Nativism's Construction of Disease in Nineteenth- and Twentieth-Century New York City", pp. 65-90.
9	11/9	Public health & political activism: The Case of HIV/AIDS	• Hives: Ronald Bayer, "The Dependent Center: The First Decade of the AIDS Epidemic in New York City", pp. 131-150. • Allan Brandt "AIDS in Historical Perspective: Four Lessons from the History of Sexually Transmitted Diseases" American Journal of Public Health, 1988, 78(4): 367-371.
10	11/16	Location as a social determinant of health II: Public health & housing (film *Unnatural Causes: Place Matters)*	• Hives: Blackmar, "Accountability for Public Health: Regulating the Housing Market in Nineteenth-Century New York City, pp. 42-64. **Annotated bibliography due by midnight on November 15th**
11	11/23	The relationship of public health to health care	• IOM Report: Chap. 5, pp. 212-26 • Gostin, Lawrence O. and Madison Powers." What Does Social Justice Require for the Public's Health? Public Health Ethics and Policy Imperatives". Health Affairs. 25(4): 1055-1060. July/August 2006

12	11/30	Public health & corporate power	• Gerald Markowitz and David Rosner,"The Limits of Thresholds: Silica and the Politics of Science 1935-1990" American Journal of Public Health, February 1995, 85(2):253-262. • Read one article from Corporations and Health Watch: http://corporationsandhealth.org/

CUNY SCHOOL OF PUBLIC HEALTH

COURSE SYLLABUS

The Graduate Center
PUBH 807 Practicum Project
3 Credits
Fall 2015

Time and location	This course will not meet.
Instructor	Daliah Heller, PhD MPH daliah.heller@sph.cuny.edu
Office hours	By appointment
Course website	https://bbhosted.cuny.edu
Support resources	For technical assistance, contact the Helpdesk. Academic support services and writing skills assistance are available.
Course description	The DPH Practicum Project is a planned, supervised and evaluated experience that allows students to apply the knowledge and skills that they have acquired through learning experiences in a practice setting. The DPH Practicum Project requires 180 practicum hours that can be completed in a range of organizations across New York City or elsewhere. Students must document how the 180 practicum hours are spent. The student must complete a detailed learning plan, a summary report (that includes objectives), a self-evaluation, and a final report.
Course prerequisites	PUBH 800, PUBH 801
Course format	The pedagogical component of this course will be administered online, including all assignments. The student will meet individually with the Course Instructor at least twice during the semester (Practicum Project period).
Required reading and resources	N.a.
Suggested reading and resources	N.a.

Program Competencies	Course Learning Objectives	Assessment Methods
This course will help you to:	*After successfully completing this course, you are expected to be able to:*	*Competencies and learning objectives will be assessed as part of the following course assignments:*
Identify, develop, evaluate and recommend policy and programmatic interventions to improve population health at individual, community, government and country levels based on empirical evidence of social, political, cultural, biological, economic, historical, behavioral, environmental, and global factors in health and disease.	Apply public health knowledge and skills to design, implement monitor, and assess health-related interventions.	• Learning Plan • Progress Report • Final Report
Assess the mechanisms and pathways by which factors influence individual and population health.		
Synthesize and apply methods, theories and data from multiple disciplines to understand and solve population health issues.	Demonstrate the application of cross-disciplinary methods, theories, and data in public health practice.	• Final Report
Generate, translate, communicate, and disseminate population health evidence to diverse audiences	Present and discuss public health research and practice in diverse settings and audiences.	• Final Report • Project-related products • Self-reflection paper
Demonstrate leadership skills to facilitate the goals of population health research and practice.		
Design and deliver innovative educational experiences that promote learning about population health in academic and practice-based settings	Apply public health research and practice innovation to a wide array of settings and situations	• Learning Plan
Implement professional and organizational ethical guidelines in population health research and practice.	Thoroughly articulate and address ethical issues in public health research and practice.	• Self-reflection paper

Secure resources to conduct population health research and practice	Identify sources of funding and material support for public health research and practice.	• Self-reflection paper

Course Assessments

Over the course of the semester, the student is required to submit four assessments: a detailed Learning Plan, a Progress Report, a Final Report, and a Self-Evaluation paper. Though not graded, the Project Preceptor must also complete and submit a Student Evaluation Report at the end of the Project.

Grading

Evaluation criteria

Student progress in the Practicum will be measured with the documents submitted over the course of the semester. A rubric is posted with each Assignment on the Blackboard course website, detailing the measures by which it will be assessed.

The relative weight of each course component is as follows:

Assessment	Weight
Learning Plan	15%
Progress Report	10%
Final Report	60%
Preceptor Evaluation	Not graded
Self-Evaluation	15%
	100%

The grading system for the course follows guidance in the Graduate Bulletin.

Letter Grade	Quality Point Value	Percentage
A+	4.00	100-98
A	4.00	97-93
A-	3.70	92-90
B+	3.30	89-88
B	3.00	87-83
B-	2.70	82-80
C+	2.30	79-78
C	2.00	77-73
C-	1.70	72-70
F	0.00	<70

The final course grade will be determined using the performance assessment described above, and resulting in a Pass (70% or higher) or a Fail (less than 70%) grade.

Withdrawal

If an emergency arises, the student must immediately notify the instructor and agree upon a course of action, especially if the student is unable to complete the course.

Students are permitted to officially withdraw from courses without academic penalty generally up until the 10th week of class. The specific policies and dates for course withdrawal are available online.

Grade of incomplete

Incomplete final grades will not be granted unless the request is justified by legitimate and documented emergencies. The granting of an incomplete grade is at the discretion of the instructor. Refer to the Student Handbook for further details.

While the program discourages students from taking Incompletes, under some circumstances, an Incomplete may be the only option for completing the Practicum Project. **A request for an Incomplete must be approved by the Course Instructor, and the incomplete grade must be resolved by the end of the subsequent semester.**

Grade appeals

When a student considers a final course grade unsatisfactory, the student should first confer with the instructor. If the student is still not satisfied, the student should promptly contact the Executive Officer of the DPH program in writing giving the factual reasons and basis for the complaint. Details about the academic appeals procedures can be found in the Student Handbook.

Course Policies

Attendance and class participation

No class will be given for this course. Students must submit Assignments to the course Blackboard site by the deadline posted. Students will be required to meet with the Course Instructor at least twice during the semester.

Late/incomplete submission of assignments

Late assignments will not be accepted unless approved by the Course Instructor, and with sufficient documentation describing the reason for lateness.

Make-ups, rewrites, and extra credit

No make-ups, rewrites, or assignments for extra credit will be offered.

Expectations of students

Students are expected to submit Assignments on time, to participate respectfully on the course Blackboard website, and to communicate with the Course Instructor on progress and problems related to the Practicum Project, as soon as issues arise.

Expectations for the instructor

The Course Instructor will grade Assignments and post results within five days of submission. The Course Instructor will respond to all emails from students within 48 hours of receipt, and will arrange face-to-face meetings with students as requested, and with Preceptors, as necessary.

Accessibility

Support services and accommodations are available to provide students with disabilities greater accessibility to the academic environment. The Vice President for Student Affairs is the 504/ADA Coordinator (Room 7301; 817-7400). For more information (with confidentiality) contact Sharon Lerner or Elise Perram (212-817-7400 or disabilityservices@gc.cuny.edu).

Academic integrity

CUNY regards acts of academic dishonesty (e.g. plagiarism, cheating on exams, obtaining unfair advantage, and falsification of records and official documents) as serious offenses against the values of intellectual honesty. CUNY is committed to enforcing the Policy on Academic Integrity and will pursue cases of academic dishonesty according to established procedures. Refer to the CUNY Policy on Academic Integrity, the Graduate Center Guide, and other sources for definitions and examples of academic dishonesty.

Course Schedule

This course schedule is subject to change.

For important dates in the semester process, please refer to the current academic calendar.

Session	Date	Topic	Assignment
1	August 31	Introduction and review of Practicum Project expectations	ONLINE PARTICIPATION: Students must log on to the Blackboard course, and on the Discussion topic provided, create a new thread introducing themselves and providing a 2-3 sentence description of their Practicum Project. Students must comment on at least one other student's posting. **DUE: By September 6**
2	August 31 thru September 10	Individual meeting with Course Instructor	IN-PERSON MEETING: Schedule and meet with Course Instructor to review Practicum Project work-plan and discuss detailed Learning Plan.
3	September 10	Learning Plan assignment	ASSIGNMENT SUBMISSION: **DUE: By September 14** Prepare a detailed Learning Plan for your Practicum Project, and submit to Blackboard
4	October 5	Progress Report assignment	ASSIGNMENT SUBMISSION: **DUE: By October 14** Prepare a progress report on your Practicum Project work to date, and submit to Blackboard and to your Practicum Sponsor.
5	November 30 thru December 12	Individual meeting with Course Instructor	IN-PERSON MEETING: Schedule and meet with Course Instructor to review Practicum Project progress and discuss plans for Final Report.

6	December 14	Final Report assignment	ASSIGNMENT SUBMISSION: **DUE: By December 14** Submit a comprehensive final report on your Practicum Project, demonstrating how the Project objectives were achieved. Submit via Blackboard, and include any attachments produced for the Project.
7	December 14	Practicum Sponsor evaluation of student	EVALUATION SUBMISSION (not graded): **DUE: By December 18** Practicum Sponsor must email a completed, co-signed evaluation form to Course Instructor. *Student should also upload the completed evaluation form to the Final Report submission on Blackboard.
8	December 14	Self-evaluation	ASSIGNMENT SUBMISSION: **DUE: By December 21** Via Blackboard, submit a final self-evaluation of your work on the Practicum Project.

DOCTOR OF PUBLIC HEALTH (DPH) PROGRAM

Program Manual

CUNY SCHOOL OF PUBLIC HEALTH

THE GRADUATE CENTER
CITY UNIVERSITY OF NEW YORK

HUNTER
The City University of New York

Brooklyn College

LEHMAN COLLEGE

The content of this Program Manual Supersedes that of all earlier Program Manuals

Note to Students and Faculty

This manual is designed to give Doctor of Public Health (DPH) Program students the information they need to successfully complete the doctoral degree and faculty the information they need to guide their students. The Graduate Center (GC) Student Handbook describes all relevant policies and is the official document for students at the GC. Students and faculty are encouraged to review that handbook as well as this manual and are expected to be familiar with all relevant GC and DPH policies.

Doctor of Public Health (DPH) Program
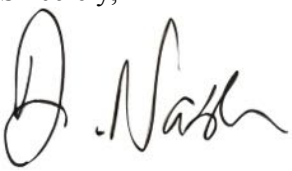
Letter from the Executive Officer

Dear Students & Faculty:

I am pleased to present you with this updated DPH Program Manual for students and faculty in which we provide an overview of the DPH program and its requirements.

The CUNY DPH Program aims to:



- Prepare public health researchers to rigorously generate and apply scientific evidence to improve the health of populations;
- Provide an interdisciplinary education in which graduates are capable of drawing on health-related theory and knowledge from multiple disciplines;
- Foster multilevel research and intervention - i.e., understanding and addressing public health issues at the individual, household, community, and policy levels; and
- Pay special attention to new and existing linkages between research, practice and policy with relevance to public health.

The mission of CUNY's DPH program is to:

- Prepare students to provide leadership in public health as researchers, managers, policy makers, advocates, and faculty in academic institutions;
- Contribute new knowledge to understanding the multi-level determinants of population health; and
- Assist communities, governments, and organizations to conduct research and interventions that promote health and prevent disease in populations.

The faculty and administration of the DPH Program work hard to ensure that the training and learning experiences of DPH students in our program are both challenging and rewarding. We want and need any help, suggestions, or feedback you can give us in order to realize our vision of a program dedicated to education leading to impactful research and action for public health. We look forward to working with you in this important phase of your training and career in public health!

Sincerely,

Denis Nash, PhD, MPH
Executive Officer, Doctor of Public Health Program, Graduate Center
Professor, Epidemiology and Biostatistics Program, Hunter College
City University of New York

Overview of the Doctor of Public Health (DPH) Program and the City University of New York (CUNY)

The Doctor of Public Health (DPH) Program

The Doctor of Public Health (DPH) program at the Graduate Center (GC) prepares students to be researchers, teachers, practitioners, and managers who can meet the public health needs of populations, including the population of New York City and around the world. It prepares future faculty members for the growing number of academic training programs in public and community health, and it prepares leaders for the public health workforce.

Courses are taught by doctoral faculty from the Public Health Programs at Brooklyn, Hunter and Lehman Colleges and the Graduate Center. Additional DPH faculty are from other participating CUNY campuses. By drawing on faculty from throughout CUNY, the DPH program offers comprehensive interdisciplinary perspectives on public health and related fields.

The CUNY DPH Program carries out teaching, research and service to create and sustain population health and to promote equitable, efficient, evidence-based solutions to pressing population health problems around the world. Informed by the values of public health, social justice and democracy, the DPH Program seeks to become a platform for collaboration to:

- Examine the causes of and solutions to pressing health problems;
- Engage the public in an ongoing dialogue on public health policy;
- Develop a workforce with the capacity to plan and implement health-promoting programs and policies.

Several themes define the unique approaches that distinguish the CUNY DPH Program. These include a focus on:

- Multi-level analysis, research and intervention;
- Understanding and improving living conditions and health to reduce inequities;
- An interdisciplinary blend of public health and social, behavioral and natural sciences;
- Practice-based research;
- Collaboration with government agencies and public health institutions (e.g. DOHMH, DOE, HHC);
- Diversity -- CUNY programs, students, faculty.

Specialization Tracks

- Community, Society and Health
- Epidemiology
- Environmental and Occupational Health
- Health Policy and Management

Qualified applicants in any track may also apply to an optional concentration in Public Health Nutrition or Maternal, Child, Reproductive and Sexual Health (MCRSH).

The City University of New York (CUNY)

The City University of New York provides high-quality, accessible education for more than 269,000 degree-credit students and 247,000 adult, continuing and professional education students at 24 campuses across New York City.

CUNY School of Public Health

The CUNY School of Public Health is committed to teaching, research and service that creates a healthier New York City and helps promote equitable, efficient and evidence-based solutions to pressing population-based health problems around the world.

Employing the resources of the nation's largest and most diverse urban university, the CUNY School of Public Health seeks to create new models of public health education for the 21st century. The school's consortial campuses (the Graduate Center and Brooklyn, Hunter, and Lehman Colleges) bring together students and faculty from throughout CUNY's academic and professional programs, engaging with practitioners, researchers, activists, community residents and policymakers from many sectors of New York City.

Vision

Promoting health and social justice in New York City and across the globe through innovation and leadership.

Mission

The mission of The CUNY School of Public Health is to provide a collaborative and accessible environment for excellence in education, research, and service in public health, to promote and sustain healthier populations in New York City and around the world, and to shape policy and practice in public health for all.

The Graduate Center (GC), CUNY

The Graduate Center (GC) is the principal doctorate-granting institution of the City University of New York. Offering more than thirty doctoral degrees from Anthropology to Urban Education, and fostering globally significant research in a wide variety of centers and institutes, the GC provides rigorous academic training in the humanities, sciences, and social sciences.

Through its extensive public programs—lectures, conferences, performances, and exhibitions—the Graduate Center contributes to the intellectual and cultural life of New York City and affirms its commitment to the premise that knowledge is a public good.

Brooklyn College, CUNY

Brooklyn College currently serves more than 17,000 students in its undergraduate and graduate program. Founded in the 1930s, Brooklyn College is an integral part of the civic, urban and artistic energy of New York and uses the entire city as a living classroom that broadens our students' understanding of the world around them.

Hunter College, CUNY

Hunter College is the largest college in the City University of New York (CUNY). Founded in 1870, it is also one of the oldest public colleges in the country. More than 23,000 students currently attend Hunter, pursuing undergraduate and graduate degrees in more than 170 areas of study.

Lehman College, CUNY

With more than 60,000 alumni and 12,000 students, Lehman College serves the Bronx and surrounding region as an intellectual, economic, and cultural center. The College is named after Herbert H. Lehman, who was governor of New York State, a U.S. Senator, and an internationalist. His values of dedicated public service continue to guide the College today.

Other CUNY Units

Several other CUNY campuses including the Baruch School of Public Affairs, the Sophie Davis School of Biomedical Education at The City College of New York, and health programs at Queens College and elsewhere contribute faculty to the CUNY DPH program.

Doctor of Public Health (DPH) Program Governance
Summary

The DPH program operates under bylaws established by the program faculty and approved by the CUNY Board of Trustees. The governance structure of the program consists of a single Executive Officer (EO), a single Deputy Executive Officer (DEO), an Assistant Program Officer (APO) and four Track Coordinators (TCs). There are five standing committees which serve to govern the program: the Executive Committee, the Elections Committee, the Faculty Membership Committee, the Curriculum and Examinations Committee, and the Admission and Awards Committee. The DPH program is represented at the Graduate Center by membership in the Graduate Council and the Doctoral Student Council.

The Executive Officer, assisted by the DEO and APO, is responsible for overall administration and oversight of the academic affairs of the program in accordance with the policies established by the standing committees, the program faculty, the Graduate Council of the GC and the CUNY Board of Trustees. The EO reports to the Provost of the Graduate Center and the Dean of the CUNY School of Public Health.

The Track Coordinators are responsible for the day to day operations of the tracks (i.e., academic operations, faculty advising). The TCs report to the EO and DEO.
See the complete DPH Program Bylaws on Blackboard.

The Executive Committee: This is the main policy-making committee for the DPH program. It is chaired by the EO, and has as members: the four TCs, one faculty member with a primary appointment at the GC (unless the EO has one), one faculty member who is not from a consortium college, three DPH students elected by their peers, and additional faculty (where necessary) to ensure representation from all of the SPH consortial campuses not represented by the EO and TCs. The minutes from the meetings of this committee are available to the public.

The Elections Committee: This committee is responsible for coordinating and overseeing all DPH program elections (both committee and TC). It has five members: the EO, one elected faculty from each of the three consortial colleges not represented by the EO, and one student member.

The Faculty Membership Committee: This committee recommends faculty members to the Executive Committee for consideration for appointments to the DPH faculty and formulates procedures for making new faculty appointments. It has seven members: The EO, four faculty members (at least one from each concentration) and two students.

The Curriculum and Examinations Committee: This committee is responsible for reviewing curriculum and recommending changes and for recommending procedures and standards for the conduct of the first and second exams. It has seven members: the EO, one faculty member from each concentration, and two student members.

The Admissions and Awards Committee: This committee recommends to the Executive Committee procedures and standards of admission and awards for the program and the concentrations. It consists of eight members: the EO, the four TCs, a GC based faculty member and two student members.

DPH Participation in CUNY SPH Governance - Summary

The governing body of the CUNY SPH shall be the Faculty and Student Council (FSC). The Faculty and Student Council shall consist of the Dean, the Associate Dean for Academic Affairs, the Campus Directors, all Core Faculty, two affiliated faculty, two staff in the title series HEO or CLT, and five students (one elected from students in each of the consortial campuses, except that two are elected from Hunter College, one from the undergraduate program and one from the masters programs). The FSC meets three times per semester.

Elections for all vacant positions shall normally be held in May prior to the semester in which service begins.
The FSC is responsible for: formulating educational policy and developing standards for admissions, academic performance and degree requirements for students consistent with the by-laws and policies of the CUNY Board of Trustees and other CUNY policies and procedures; reviewing programs and curricula; recommending to the Dean and the CUNY Board of Trustees the granting of undergraduate degrees, graduate degrees and honorary degrees to qualified candidates; considering any other academic matters and making recommendations to the Dean and the CUNY Board of Trustees; establishing or abolishing such standing or temporary committees as it deems necessary and considering reports and recommendations of those committees; and recommending revisions to the SPH Governance Plan.
See the complete CUNY SPH Bylaws and Governance Change May 22nd 2013, both on Blackboard.

DPH Participation in GC Governance - Summary

The Graduate Council is the academic governing body of The Graduate School and University Center, and the Bylaws of Graduate Council set forth its rules of governance. Members include representatives of the faculty, doctoral students, and administration. The President of The Graduate Center is the Chair of Graduate Council. The Executive Committee of Graduate Council formulates the agenda and brings actions to Graduate Council, which meets four times each year. Graduate Council is concerned with such matters as curriculum, degree requirements, standards of admission, academic performance, and program governance. Much of the work of Graduate Council is done through its standing committees. Elections of faculty and student program representatives to Graduate Council are required to be conducted annually, before April 1, by an election committee in each program; the basic formula for the election is one faculty and one doctoral student representative for each hundred or fewer matriculated doctoral students (GC Bylaws 2.1A–D).
If a student is not elected as the Graduate Council representative, the Doctoral Student Council representative is the default.

Doctoral Students' Council (DSC) – Summary

The Doctoral Students' Council and its officers are charged with representing student interests before the administration and external bodies.

In addition to informal and ongoing communications, the DSC officers meet with members of Graduate Center administration to report activities and exchange information.
Students may have issues presented by their DSC representatives or the DSC Executive Committee before the Doctoral Students' Council, or can personally address the Council by requesting to be put on the DSC agenda for an upcoming meeting. This may, in turn, result in discussion or actions taken within the DSC or between the DSC and the administration.

The DSC members also act as advocates for graduate student interests at the Board of Trustees, University Student Senate, University Faculty Senate, New York State Assembly, the Mayor's Office, and with Graduate Center administration.
Each spring, the DSC conducts elections for its representatives and student representatives to specific Graduate Center bodies. The nominations and elections process is held online; no paper ballots are mailed.
To make a nomination(s) for Program Representative, Advocate Advisory Board, OpenCUNY Board, At-large Representative, the Disciplinary Panel, Student Academic Appeals Officer, and the Student Elections Review Committee, see page 78.

Satisfactory Progress, Academic Honesty, Registration, Levels, and Advising

Satisfactory Progress

The Graduate Center requires its faculty to assess each semester whether students are making satisfactory progress. Those who are not making such progress will be asked to develop a plan to correct any shortcomings or will be asked to leave the program.

A DPH student is deemed NOT to be making satisfactory progress if she or he:

1. Has completed 36 credits and not passed the First Examination;
2. Has a cumulative grade point average below 3.00;
3. Has not completed the Second Examination within 48 credits of matriculating;
4. Has not completed the degree in six years*;
5. Has accumulated more than two open grades ("INC," "INP," "NGR," "ABS," and "ABP");
6. For students that do not have an MPH degree, not having completed all five core Master's level public health courses prior to enrolling in the second year of coursework.

If a student is found not making satisfactory progress a hold will be put on their record. A "SatProg" report is generated by the GC Registrar Office and both the DPH program office and the student is informed of the reason for the hold. A plan is developed by the student, advisor, and TC. The EO is informed of the student's progress and that plan submitted by the EO to the Student Affairs Office. Upon approval of the plan by the Vice President of Student Affairs, it is then submitted to the Registrar and the hold is lifted.

*The summer semester is considered an additional semester. For example, if a student takes courses in the fall, spring, and summer semesters in one academic year, this is reported as three semesters in the total 12 semester (6 year) allotment to complete the degree.

Academic Honesty

The Graduate Center outlines a clear definition of Academic Honesty and the DPH program expects students to know and follow the CUNY Academic Integrity Policy. Both can be found in the GC Student Handbook as well as through this link to the GC Avoiding and Detecting Plagiarism guide.
http://www.gc.cuny.edu/CUNY_GC/media/CUNY-Graduate-Center/PDF/Publications/Student_Handbook_web.pdf?ext=.pdf

Registration
DPH students can register only after the Tracking Form is completed by the student and approved by their Advisor, TC and the EO. Students are responsible for ensuring that the form is reviewed and signed (electronic or physically) by the Advisor and Track Coordinator.

If you plan to register for:

- A course at another CUNY school that is not co-listed with a DPH program course (i.e. does not have a PUBH prefix).
  Students must submit a Permit Out form to the APO. The Permit Out form can be found on the GC Registrar webpage. Please note that each CUNY college has its own rules for permitting in and that additional steps apply for permitting out for summer courses.

- A course in another program at the GC that is not open to DPH students.
  All GC courses can be found on the Dynamic Course Schedule. Students must contact the instructor and request permission to register for the course. Please be aware that GC Program's set their own policies. Depending on the Program, the override will be set by the instructor, the APO, or the EO. The DPH administrators cannot set overrides for courses outside of the DPH program.

- PUBH 807 Practicum Project
  Students must fill out the Practicum Project Application available on Blackboard. Please see pages 12-14 of this manual. Students can register only after the application is approved.

- PUBH 861 Independent Study
  Students must fill out the Independent Study Application available on Blackboard. Please see page 17 of this manual. Students can register using a faculty-specific CRN* only after the application is approved.

- PUBH 891 Advanced Research Seminar II
  Students must have defended their Second Exam or have permission from the instructor and have the Second Exam defense scheduled within the first two weeks of the semester. Students must successfully defend the Second Exam to continue the course past the first two weeks of the semester. Please see pages 15, 39-46 of this manual.

- PUBH 900 Dissertation Supervision
  Students must inform the APO which faculty member you intend to study with. The APO will reply to you with a CRN* number. Please see pages 16, 47-70.

At this time, DPH students can register for Inter-University Doctoral Consortium courses, but can only register for courses listed or cross-listed within any of the consortium Graduate School of Arts and Sciences (GSAS). Please read the section Inter-University Doctoral Consortium in the GC Student Handbook for additional details. Fill out the Consortium Permit Out form and submit it to the APO for the EO's signature. The APO will then submit it to the Vice President for Student Affairs for approval.

*identifies a particular course and section offered for the semester.

Semester Course Schedules
Prior to each semester's registration period, the DPH program will distribute and post on Blackboard the DPH schedule that contains DPH course listings, suggested courses in other programs, and processes for registering.

The GC Dynamic Schedule is updated live by the GC Registrar.
https://ssb.gc.cuny.edu/prod/plsql/bwckschd.p_disp_dyn_sched

The DPH website is periodically updated with semester course listings.
http://www.gc.cuny.edu/Page-Elements/Academics-Research-Centers-Initiatives/Doctoral-Programs/Public-Health-DPH/Courses---Curriculum

Graduate Center Registrar
Refer to the GC Registrar webpage for Course Listings and Schedule, Academic Calendars, GC Publications (GC Bulletin; Student Handbook), and important downloadable forms.
http://www.gc.cuny.edu/Prospective-Current-Students/Current-Students/Registration

Curriculum Changes Over Time
Students should refer to the GC Bulletin or pages 9-29 for the requirements by their year admitted. Hard copies of previous year's Bulletins are available in the Library and Registrar's office. However, if the change is more rigorous, then the student is grandfathered into the previous curriculum. If the change is less rigorous, it overrides the previous curriculum. Finally, if a student left the program and was readmitted (not including formal leaves of absence) the Bulletin from when the student is readmitted is the one they should follow.

Status
All students are required to be in status each semester. This means that students must either be registered or be on an approved leave of absence. Individuals who are not in status will be considered withdrawn from the Graduate Center and an application for remittance must be submitted.
http://www.gc.cuny.edu/CUNY_GC/media/CUNY-Graduate-Center/PDF/Forms/Readmission.pdf?ext=.pdf

Levels II and III
DPH students reach Level II after passing the completion of 45 credits and passing the First Exam. Tuition and status is atomically changed to full-time.

DPH students can request to be Advanced to Candidacy to Level III at the completion of all coursework (at least 48 credits) and passing the First and Second Exams and successfully defend their dissertation proposal. A student does not apply to be advanced to Level III and it is not "automatic." It is an online form that is submitted by the APO or EO and requires communication with the student. Once a student reaches the criteria noted, and if not flagged by either the Sponsor or Registrar, the student should contact the APO or EO and request to be advanced. The student should confirm the following: tentative or actual dissertation title; committee members and their roles; date of successful dissertation proposal defense, and the tentative or actual defense and deposit dates. Students must be advanced before deposit. Once a student is advanced, no changes can be made to the transcript. At this time, if the student has not had the Human Participants Clearance form submitted and processed (see page 51, dissertation proposal) the student will be asked to proceed with that process at advancement.

After advancement, tuition is atomically changed to full-time status and at a reduced tuition rate.

Waiving out of a DPH Program Course
With approval of the Advisor/Sponsor, Track Coordinator and Executive Officer a student may request to be waived from a DPH program course. If a course is waived, the student must replace the equal amount of credits with another course as approved by their advisor. For example, if a student took an advanced Masters level Epidemiology course deemed equivalent to PUBH 820 Epidemiologic Methods I, that student may be waived from PUBH 820 and will need to take a three-credit course in its place. Usual procedures for course waiver are to present a course description of the course taken elsewhere and the transcript noting the grade received or to pass an examination based on the course.

Weighted Instructional Units
Weighted Instructional Units (WIUs) are used to document that graduate study extends beyond traditional classroom learning. They do not have credit value but are a mechanism to recognize non-classroom academic work involved in earning a graduate degree. As such, they are used in calculations to determine if a student may be certified as having full-time status at The Graduate Center. They are typically used for more advanced students who have completed their coursework and are at the First Exam stage or beyond. Semester-specific WIU registration CRNs are distributed by the Registrar and the APO before each registration period. Students should register for 7 WIUs if full time status is necessary.

Faculty Advisors
A faculty advisor guides the student though the DPH coursework, completion of the first exam, and application for the second exam. Track Coordinators assign advisors before or during the student's first semester in the program. Advisors can also help students to develop dissertation ideas and suggest faculty who can serve as members of the Second Exam and dissertation committees. The faculty advisor may or may not serve as the student's second exam or dissertation sponsor.

The advisor will communicate with students to discuss course planning, academic issues, and career guidance. Advisors are also responsible for helping students make satisfactory academic progress towards their degree. Students are expected to communicate with their advisors at least twice a semester and more often as needed. Within the first year of coursework, students should discuss possible dissertation topics and research questions with their advisor, as well as potential faculty sponsors for the student's dissertation research.
Each semester the student will submit an electronic tracking form (on Blackboard) to their advisor for course selection approval. Students are responsible for ensuring that the form is reviewed and signed (electronic or physically).

Either a doctoral program faculty member or a student can request a change of advisor by discussing the request with the Track Coordinator, who must approve the change.

Coursework in the DPH Program

Credits

The DPH curriculum consists of 48 post-master's degree credits (note: the DPH Program is in the process of applying for approvals of a reduction in the number of credits associated with the dissertation of 12 to 0, for a total of 48. This manual reflects that change. If this change is not approved, an announcement will be made and an amendment to this manual will be posted on Blackboard). Students can take up to 6 credits within the CUNY SPH Master's in Public Health (MPH) Programs or other Master's level programs throughout CUNY. Students may also take up to 6 Independent Study credits at the Graduate Center. With the permission of their advisor and the EO, students may transfer in a certain amount (in general, no more than 12) of doctoral-level credits from other doctoral degree programs. For students who are waived out of a course, the same number of credits must be taken to replace the waived course. The degree must be completed within six years of matriculation or will be considered not making Satisfactory Progress, see page 5.

Students Without an MPH Degree

DPH students who do not have a Master's in Public Health (MPH) degree must have the five core MPH courses that are required by the CUNY SPH MPH programs completed by the end of their first year of enrollment. The five master's level courses are:

- Introductory Biostatistics
- Introductory Epidemiology
- Environmental Health
- Social and Behavioral Dimensions of Health
- Health Policy and Management

Three of the 5 prerequisite courses must be completed prior to acceptance into the DPH program. None of these credits will count toward the doctoral degree even if the remaining two master's-level courses are taken while matriculated in the DPH program. It is the responsibility of the student, in consultation with his/her Advisor and Track Coordinator, to ensure that remaining core MPH courses are completed within the first year of enrollment. Failure to do so will be considered not making Satisfactory Progress (see page 5) toward to degree and will interfere with the academic progress of the student.

Coursework and Curriculum

In keeping with the interdisciplinary focus of the DPH program, all students are required to take public health courses within a specialization area, additional courses in research methods, theory or public health practice, and at least one doctoral course outside of public health. Course selection is determined through consultation between the student and the advisor. If a DPH course is cross-listed with another GC program, that course can count toward the interdisciplinary requirement.

Students are required to complete the core DPH courses, track-specific course requirements, advanced research seminars and dissertation research.

Overview of Required Courses for all DPH Students

Requirements for all DPH students:	
PUBH 800	Cities, Society, and Health
PUBH 801	Interdisciplinary Approaches to Urban Health Research
PUBH 805/802 (EPI take PUBH 824)	Quantitative Research Methods with Applications to Urban Health
PUBH 806 (2012 and following cohorts)	Qualitative Research Methods with Application to Urban Health
PUBH 893	Leadership & Organizational Change Seminar
PUBH 807	Practicum Project
PUBH 820	Epidemiologic Methods I
PUBH 890	Advanced Research Seminar I
PUBH 891	Advanced Research Seminar II
PUBH 900	Dissertation Supervision
PUBH 898	Dissertation Seminar

Core Courses

PUBH 800 Cities, Society, and Health (3 credits): This course presents an ecological, multilevel approach to the study of urban health and brings together public health and social science disciplines to examine the impact of city living on population health.

- *Required for all cohorts, all tracks*

PUBH 801 Interdisciplinary Approaches to Urban Health Research (3 credits): This course prepares students to investigate causes and solutions to complex urban health problems by bringing together concepts, theories and methods from a variety of disciplines that contribute to our understanding of urban health. It also focuses on research that contributes to reducing health disparities and promoting well-being in urban communities.

- *Required for all cohorts, all tracks*
- *Prerequisite: PUBH 800*

PUBH 805 Quantitative Research Methods with Applications to Urban Health (3 credits): This course will introduce students to intermediate level approaches and applications in conducting quantitative research in urban public health. It follows introductory biostatistics and epidemiology courses. Course objectives include understanding the assumptions, application, and interpretation of generalized linear regression models, including linear, logistic, Poisson, and proportional hazards models; understanding standard methods for making inferences on model parameters, including Wald testing and ratio testing; and being able to fit generalized linear regression models and diagnose the appropriateness of models using standard statistical software. Particular attention will be made to choosing and defining the right outcome(s), given specific research questions and available data; defining appropriate comparison groups; and understanding the assumptions of each model in order to make appropriate choices and analytic decisions for different types of data and research questions common to urban health research. Labs will allow students to practice these new skills. The final examination will include a project in which students develop and carry out an analysis of an urban health research question using a publically accessible dataset.

- *Required for all cohorts in CSH, EOH, and HPM tracks. For EPI students PUBH 824 Applied Biostatistics should be taken in its place*
- *For cohorts preceding 2012, this course should be used to meet the prior requirement for PUBH 802 Advanced Methods & Ethical Issues in Urban Health Research*
- *Prerequisite or Co-requisite: 820 Epidemiologic Methods I or equivalent*

PUBH 806 Qualitative Research Methods with Application to Urban Health (3 credits): This course will introduce students to approaches in designing and conducting qualitative research in topics of relevance to public health. It is intended to provide doctoral students with a foundation in the various qualitative data collection and analysis methods, focusing on their application to public health practice and research. It will cover elements of qualitative research design, data collection, analysis, and writing for publication. This will be integrated with the main assignment in which students develop a proposal for a qualitative research project tailored to address a specific public health research question.

- *Required for the 2012 and following cohorts*

PUBH 807 Practicum Project(3 credits) (Pass/Fail): The DPH Practicum Project is a planned, supervised and evaluated experience that allows students to apply the knowledge and skills that they have acquired through learning experiences in a practice setting. The DPH Practicum Project requires 180 practicum hours that can be completed in a range of organizations across New York City or elsewhere. Students must document how the 180 practicum hours are spent. The student must complete a detailed learning plan, a summary report (that includes objectives), a self-evaluation, and a final report. It is the belief of the DPH Program and the CUNY School of Public Health that there is always a new topical, methodological, or positional approach that will allow students to gain new experience or skills or benefit from the additional practical experience. Therefore, the Practicum Project requirement cannot be waived, as even students with extensive experience in public health practice and leadership can benefit from applied public health experiences that they have not yet encountered in their careers.

A Practicum Project requires a Practicum Sponsor. A Practicum Sponsor is usually not a DPH faculty member, nor faculty of another academic organization, because the Practicum Project is meant to be action-oriented, leading to public health action. However, the proposed Practicum Project may meet this criterion if it involves collaboration between the CUNY SPH or another academic organization and an external, non-academic organization, with the express purpose of producing work that generates public health action.

Before the student registers, the PUBH 807 Practicum Project Application must be approved by the Practicum Sponsor and the Course Instructor (on Blackboard).

The content of Practicum Projects must be related to public health action and be practice-oriented. A Practicum Project can include any aspect of public health practice, including leadership, practice-based research or evaluation, dissemination, primary data collection, data management, data analysis, manuscript/report preparation, policy development or analysis, community-based or organizational capacity building in public health, conducting a systematic literature review, designing data collection instruments, developing research/evaluation/intervention protocols, and developing grant proposals. While any of this work can be part of a project team, the work that is specifically being conducted by the student and the student contribution to the project (over and above those of others on the project team) must be clearly delineated and approved by the Practicum Sponsor. See the Frequently Asked Questions on the next page.

The student will develop a detailed learning/work plan that includes the hours/dates associated with all activities, project objectives, a description of activities, and a description of the final product and how it will be assessed. This will be reviewed and approved by the Practicum Sponsor and will be used to evaluate the student at the end of the project. The student meets with the Practicum Project Sponsor weekly. The final assessment will be based primarily on the final practicum report, which must document the achievement of each of the project objectives. Each must include a detailed self-evaluation, a summary of the project activities and how the project objectives were met. The Practicum Sponsor must evaluate the final project and assign a pass/fail grade (where fail is less than 70%). The final Practicum Project grade will be determined by this grade in combination with grades given by the Course Instructor for three other submissions completed over the Project period: Detailed Learning Plan (15%), Progress Report (10%), Final Report (60%), Self-evaluation/Reflection (15%). The Course Instructor assigns the final grade.

- *Required for all cohorts, all tracks**
- *Approval of Application by Practicum Sponsor and Course Director*
- *Prerequisites: PUBH 800;PUBH 801*

PUBH 807 Practicum Project- Frequently Asked Questions

How many practicum hours must the DPH Practicum Project be to fulfill the program requirement? Am I required to complete these hours on a full-time working basis, or can they be spread out over time?

- Students must complete 180 hours on the DPH Practicum Project to fulfill the program requirement, but these hours may be spread out over the days and weeks of the semester.

What if I am unable to complete my DPH Practicum Project in one semester – can I take an Incomplete in the course, and complete it during the following semester?

- While the program discourages students from taking Incompletes, under some circumstances, an Incomplete may be the only option. For example, when a student's project work requires a longer period of time than the academic semester, or a different period of time, which extends into the next semester. This situation may arise due to the nature of the project or because of the practicum sponsor organization's timeline. A request for an Incomplete must be approved by the Course Instructor, and the incomplete grade must be resolved by the end of the subsequent semester.

I've worked in the public health field for many years, including in leadership positions, on many health issues, and across public and private sectors. Can I waive the DPH Practicum Project requirement and receive equivalent credit for my professional experience?

No. The DPH Practicum Project requirement may not be waived under any circumstance. It is the belief of the Program and the CUNY School of Public Health that there is always a new topical, methodological, or positional approach that will allow students to gain new experience or skills or benefit from the additional practical experience.

I already consider myself a public health professional. What are the goals of the DPH Practicum Project? What is the additional expertise or experience I'm expected to gain from this program requirement?

- The DPH Practicum Project is intended to provide students with real world experience in public health practice. Students should plan a Practicum Project in an area in which they do not have extensive experience in order to gain new skills and experience. This could take many forms, but must provide an application of public health knowledge and skills, and be action-oriented, i.e., work that leads to public health action. For example, students could work on designing or implementing a program, writing a grant, promoting an idea or policy via a report or a set of targeted papers or a series of policy briefs, etc.

Can I complete the DPH Practicum Project by doing research work with a faculty member at CUNY SPH or a faculty member at another academic institution?

- The main requirement for the DPH Practicum Project is that it must be conducted at or in collaboration with an external non-academic organization engaged in or with a mission of public health practice. The Practicum Sponsor for the DPH Practicum Project may be based at an academic organization, including CUNY SPH, but the work must be conducted in partnership with the external non-academic organization.

If I've identified an organization where I would like to complete my DPH Practicum Project, can I just tell them what I want to do there? What role do they have to play in the development and design of my project?

- Students must work collaboratively with the potential practicum sponsor organization to design and develop their DPH Practicum Project in accordance with the expectations of the DPH program. The work of the DPH Practicum Project must be linked to the practice mission of the practicum sponsor organization, including if it is an academic partnership, and oriented to develop the goals and objectives of that work.

What are the DPH Practicum Project criteria?

- First, the Practicum Project must be clearly oriented towards public health practice; the learning/work plan for the proposed Project must clearly reflect how it will contribute to public health action. Second, the Practicum Project must be directly linked to the mission, goals, and objectives of the practicum sponsor organization. Third, the Practicum Project must be conducted at or in collaboration with an external non-academic organization; an academic partnership, with CUNY SPH or some other academic organization, is acceptable, as long as the work is shaped by a practice orientation, rather than research.

Can I conduct research and write a paper for publication in the peer-reviewed literature as my DPH Practicum Project?

- Research and writing for publication alone do not meet the core expectations for the DPH Practicum Project. While these activities may be involved or even central, student practicum work must involve more than the generation and/or synthesis of knowledge. For example, a systematic literature review would be acceptable if it was linked to a public health practice goal of the practicum sponsor organization, such as if the review would be presented as evidence for the need to develop or modify a particular public health-related policy or intervention. As noted above, the Project must involve work that leads to public health action.

** Students in the 2013 and preceding cohorts who have not completed the Leadership Project may do so by registering for the PUBH 807 Practicum Project. Depending on cohort requirements (2012 and 2013 Cohorts: PUBH 89201 and 02 Leadership Project; 2011 and Preceding Cohorts: PUBH 89201 and 02 Leadership Project & a 3 credit leadership elective) this option will require replacing credits (3 or 6) with additional course(s).*

PUBH 820 Epidemiologic Methods I Research Design and Inference (3 credits): This course provides an intermediate-level understanding of the design and conduct of epidemiologic studies, including causal inference, measurement, major study designs, threats to validity, and their application to public health issues. The class includes lectures on research methods, hands-on data analysis exercises, discussions about determining causation through epidemiological research.

- *Required for all cohorts, all tracks*

PUBH 893 Leadership & Organizational Change Seminar (3 credits): The Public Health Leadership Seminar introduces students to theories and models of leadership and organizational change and helps students to analyze their own strengths and weaknesses as leaders. Using a case study approach, students analyze successful and unsuccessful examples of public health leadership and organizational change.

- *Required for all cohorts, all tracks*
- *Prerequisite: PUBH 800;PUBH 801*

Research and Dissertation Seminars

All students are required to complete an original dissertation research project. For a full explanation of this process, see pages 47-70 for Dissertation Guidelines. To prepare for the dissertation, students take two research seminars, the first within the second year of coursework (PUBH 890) and the second after completing all required courses (PUBH 891). While students are writing the dissertation, they register for PUBH 900 Dissertation Supervision and PUBH 898 Dissertation Seminar.

PUBH 890 Advanced Research Seminar I (3 credits): Students develop specific research questions pertaining to potential areas of interest for their doctoral dissertations and prepare a proposal that specifies a research question, a public health rationale for the study and an appropriate research design and methods. Students will be expected to complete a literature review and design a study, which may later lead to a dissertation proposal.

- *Required for all cohorts, all tracks*
- *Prerequisites: PUBH 800; PUBH 801*

PUBH 891 Advanced Research Seminar II (3 credits): Guides advanced students in the completion of their dissertation proposal and, if needed, Institutional Review Board (IRB) application for dissertation research. Faculty assist students to refine the research design, to fully develop appropriate research methods and analytic strategies and to provide protection for human subjects in their dissertation research. In order to take PUBH 891 Research Seminar II, students need to have defended the Second Exam or have permission of the instructor and have the Second Exam defense scheduled within the first two weeks of the semester. Students must successfully defend the Second Exam within the first two weeks of the semester in order to remain in the course.

As part of PUBH 891 students are required to complete and submit The Dissertation Progress Report.

The online component of CUNY's Responsible Conduct of Research (RCR) is a required part of this course. DPH students will be exempt from the in-person workshop of CUNY's RCR.

- *Required for all cohorts, all tracks*
- *Prerequisites: All other coursework; successful defense of the Second Exam*

PUBH 898 Dissertation Seminar (0 credits): This is a non-credit required course that students must take every semester they are working on the dissertation and registered for PUBH 900. The dissertation seminar meets up to four times a semester and serves as a workshop in which students attend Public Health Grand Rounds, present and discuss their dissertation research, and review aspects of each other's work (peer review).
The student must be registered for this course number in the same or preceding semester the student deposits the dissertation. After the student is advanced to candidacy, this course number will appear as audit on the transcript. See pages 47-70.

- *Required for all cohorts, all tracks*
- *Prerequisites: All coursework and exams*
- *Taken only while working on the dissertation and registered for PUBH 900*

PUBH 900 Dissertation Supervision (0 credits): Students pursue doctoral research leading to the required dissertation under the supervision of their dissertation sponsor. Doctoral faculty provide supervision on research design, data management and analysis, presentation and interpretation of findings.
The student must be registered for this course number in the same or preceding semester the student deposits thee dissertation. After the student is advanced to candidacy, this course number will appear as audit on the transcript. See pages 47-70.

Grades of NRP (No Record of Progress) or SP (Satisfactory Progress) will appear when the student is enrolled and will change to P when the student graduates.

- *Required for all cohorts, all tracks*
- *Prerequisites: All coursework and exams*
- *Taken only while working on the dissertation and registered for PUBH 898*

Examinations

Students in all cohorts and all tracks take two examinations to test their mastery of the curriculum. Students must apply in advance to take each exam and students must be in good academic standing to apply. The First Exam is given after students have completed core coursework. Students work on the Second Exam after all required coursework has been completed except PUBH 891 and the dissertation (PUBH 900 & PUBH 898). Students cannot take PUBH 891 or begin their dissertation research until they have passed this exam. See pages 37-46 for more details on the First and Second Examinations.

Topics Courses and Independent Study

PUBH 851 Topics in Public Health (1-3 credits): All provisional DPH electives are listed with the number PUBH 851. A provisional elective may run a total of three semesters, after which it must be approved by the Curriculum Committee and FSC and assigned a permanent course number.

PUBH 861 Independent Study (1-3): Students may work with a DPH faculty member sponsor on an independent study project ranging from 1-3 credits. A total of 6 independent study credits may be used toward the degree. A faculty member may not be on sabbatical while acting as an independent study sponsor. Faculty outside of the DPH program cannot sponsor an independent study, nor can adjunct faculty. Independent study can only be registered for during the regular academic year. As a guide, a one credit independent study should correspond to about 45 hours of work (3 hours per week X 15 weeks), a two credit independent study should correspond to about 90 hours of work (6 hours per week X 15 weeks), and a three credit independent study should correspond to about 135 hours of work (9 hours per week X 15 weeks). Applications for Independent Study can be found on Blackboard.

The sponsoring faculty member and student must have a one-page independent study proposal approved by the student's advisor and TC. The proposal must include learning objectives, milestones, evaluation criteria, and a timeline with a final evaluation by the sponsoring faculty member.

Community, Society, and Health (CSH)

This track prepares researchers and public health practitioners to advance scientific understanding of the social determinants of health, health behaviors, the delivery of health services, and the development of sound health policies. CSH graduates will be able to lead, plan, manage, and evaluate community health interventions. The track draws on the methods and theories from multiple disciplines to prepare students to design and implement public health programs and research/evaluation studies.

The CSH Track prepares researchers and public health practitioners who can:

- Advance scientific understanding of the social determinants of health, health behaviors, the delivery of health services, and the development of sound health policies.
- Lead, design, manage, and evaluate community health interventions.
- Draw on the methods and theories from multiple disciplines to design and implement research studies on population health.
- Formulate, analyze and advocate for policies that promote health and prevent disease.
- Teach students and professionals about the social determinants of health, health behaviors, health interventions, health policy, and health disparities.

Curriculum:
The core curriculum in CSH includes courses on social dimensions of health theories and research methodology. Electives are chosen in consultation with the faculty advisor.

Requirements for all CSH students:	
PUBH 810	Community Health Interventions: Theory and Methods
PUBH 811	Social and Behavioral Dimensions of Health: Theory and Methods
PUBH 816 (2012 and following cohorts)	Evaluation of Public Health Programs and Policies
Plus, cohorts preceding 2012:	
Five electives in research methods or public health practice, one of which must be from a Graduate Center program outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement), one leadership elective, Public Health or MPH courses on population or health problem specific issues; one elective course on social aspects of health in sociology, psychology, anthropology or related fields; and two research methods courses.	
Plus, cohorts 2012 & 2013	
Three advanced research methods or track-specific practice courses, one of which must be from a Graduate Center program outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement).	
Plus, cohort 2014 and following	
Four advanced research methods or track-specific practice courses, of which one must be from a Graduate Center department outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement).	

PUBH 811 Social and Behavioral Dimensions of Health: Theory and Methods (3 credits): This course prepares students to understand the impact of social structures and social environments on health and health behavior. Using an interdisciplinary approach, the course examines the contributions of sociology, anthropology, economics, psychology, history and political science to the study of health and health behavior.

• *Required for all CSH students*

PUBH 810 Community Health Interventions: Theory and Methods (3 credits): This course prepares students to lead research/intervention teams that plan, implement and evaluate community health interventions in community settings**.**

- *Required for all CSH students*
- *Prerequisite or co-requisite: PUBH 811*
- *At least two Master's level courses in program development or evaluation and at least one year of work experience in community health settings. These requirements can be waived with permission of instructor for students who bring other relevant experiences to the course.*

PUBH 816 Evaluation of Public Health Programs and Policies (3 credits): Prepares students to design evaluations of public health programs and policies; uses a systems approach to identify key constituencies and tasks in evaluation; students design an evaluation of an existing program or policy.

- *Required for the 2012 cohort and following cohorts*
- *For cohorts preceding 2012, this course can be used toward an elective requirement. Please check with your advisor.*

Epidemiology (EPI)

The mission of the Epidemiology Track of the DPH Program is to train epidemiologists as researchers and public health practitioners with a set of core competencies making them capable of rigorously applying epidemiological and biostatistical methods to the wide array of public health challenges. This includes the ability to: authoritatively generate, contribute, and disseminate new knowledge to their fields through research; to be critical consumers of evidence generated by others in their field; and to become independent, lifelong learners in development and application of epidemiologic methods. This mission is achieved through the teaching of epidemiologic methods and their applications to pressing public health problems, promotion of independent learning, and hands-on mentoring of rigorous, impactful and innovative epidemiologic research in the dissertation phase.

Curriculum:
The core curriculum in EPI includes coursework in epidemiologic methods and statistical methods. Electives are chosen in consultation with the faculty advisor.

Requirements for all EPI students:	
PUBH 821	Epidemiologic Methods II: Study Design and Analysis
PUBH 822	Epidemiologic Methods III: Seminar in Epidemiologic Methods
PUBH 823	Epidemiologic Methods IV: Seminar in applications of epidemiologic methods to urban health
PUBH 824 (required for the 2014 cohort and following)	Applied Biostatistics I
PUBH 825 (required for the 2014 cohort and following)	Applied Biostatistics II
Plus, cohorts preceding 2012:	
Four electives, one of which must be from a Graduate Center program outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement), one leadership elective, two in statistical methods and one elective in a specific content area, 2 electives, GC or Public Health courses in statistics, one of which can be a course in a software package and one in population or health-issue specific; and one elective course on statistics in sociology, psychology, or other related fields.	
Plus, cohorts 2012 and following	
Three advanced research methods or track-specific practice courses, one of which must be from a Graduate Center program outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement).	

PUBH 821 Epidemiologic Methods II: Study Design and Analysis (3 credits): Through lectures and problem-solving workshops, this course broadens the approach to epidemiologic methods, incorporating principles from Methods I into the design and conduct of studies and analysis of epidemiologic data. It consists of lectures and problem-solving workshops.

- *Required for all EPI students*
- *Prerequisite: PUBH 820 or equivalent or permission of track coordinator*

PUBH 822 Epidemiologic Methods III: **Seminar in Epidemiologic Methods (3 credits):** This seminar exposes students to emerging concepts and methods in epidemiologic research and provides students with an opportunity to apply new methods and consider how these strategies complement, and advance the more commonly used strategies in epidemiology.

- *Required for all EPI students*
- *Prerequisite: PUBH 821*

PUBH 823 Epidemiologic Methods IV: **Seminar in applications of epidemiologic methods (3 credits):** This seminar is intended to help students integrate the concepts and methods of epidemiologic research with specific inquiry directed at understanding, and improving the health of populations. This seminar requires students to develop proposals for epidemiologic research, identify strategies for data analysis that incorporate the lessons learned in Methods courses I, II, and III and to examine the application of those strategies to existing research. This course helps "bring together" the epidemiology theory and methods that have been discussed throughout the rest of the curriculum to the particular exigencies of public health research.

- *Required for all EPI students*
- *Prerequisite: PUBH 822*

PUBH 824 Applied Biostatistics I (3 credits):
For public health professionals to be effective, they must be able to ensure that policies and interventions are evidence-based. Epidemiologists design studies to determine which policies and interventions are most effective in promoting healthy individuals, families and societies. Biostatistics provides epidemiologists with the necessary tool kit to appropriately analyze public health data. The emphasis of this class is on acquiring a

set of foundational tools in regression models to apply to public health research questions and data. Topics include simple and multiple linear regression, logistic regression, ordinal and polytomous regression and model building techniques including assessing for multi-collinearity, effect measure modification, non-linearity and model fit statistics.

- *Required for the EPI 2014 cohort and following*
- *For EPI students, this course should be taken instead of PUBH 805*
- *Co or Prerequisite: Graduate-level introductory biostatics course*

PUBH 825 Applied Biostatistics II (3 credits):
This course is designed to expand on the biostatistical methods covered in Applied Biostatistics I to deepen the analytic repertoire of students with respect to regression modeling through the introduction of loglinear and generalized linear models including Poisson and Negative Binomial regressions as well as introduce techniques for analysis of longitudinal data including random and mixed effect models, and survival analysis.

- *Required for the EPI 2014 cohort and following*
- *Prerequisite: PUBH 824*

Environmental and Occupational Health (EOH)

The EOH track trains doctoral-level researchers and teachers about Environmental and Occupational Health problems affecting populations. Students have backgrounds in environmental science, occupational health, industrial hygiene, environmental policy, environmental epidemiology, and other related fields. The program includes a focus on Environmental and Occupational Health regulation, as well as planning and its impact on human health. The curriculum combines an understanding of how elements of the urban infrastructure – e.g., the built environment, commerce and productive activities, energy and communication systems, water, waste management and transport systems – interact with macrosocial trends (e.g., demographic, economic, and political processes) to affect environmental conditions (e.g., air, water, land and workplace) and human health. Coursework and research is aimed at furthering scientific understanding of the ways in which urbanization compromises the physical environment and human health as well as the ways in which it promotes health. topics such as environmental sustainability, environmental justice, economic viability, and political participation are examined.

The EOH track will produce graduates who can:

- Advance the scientific understanding of the impact of environmental and occupational conditions on health and disease.
- Plan, lead and manage studies to monitor and evaluate the heath effects of potential hazards in the workplace and broader environment.
- Plan, direct, manage and evaluate environmental and occupational health programs.
- Teach students and professionals about the impact of environmental and occupational hazards on the health of populations and about strategies for controlling such exposures.

Curriculum:
The core curriculum in EOH includes courses on the health impacts of the physical environment and research methodology. Electives are chosen in consultation with the faculty advisor.

Requirements for all EOH students:	
PUBH 830	Emerging Issues in Environmental and Occupational Health
PUBH 831	Environmental and Occupational Health Risk Assessment, Management and Communication in Urban Settings
One urban environment course (required for the 2014 cohorts and following)	
Plus, cohorts preceding 2012:	
Five electives: two in research methods in environmental or occupational health, one of which must be from a Graduate Center program outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement), one leadership elective, one course in statistics or instrumentation; one course in geographic information systems.	
Plus, 2012 cohort and following	
Four advanced research methods or track-specific practice courses, one of which must be from a Graduate Center program outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement) and one must be a course focusing on the urban environment.	

PUBH 830 Emerging Issues in Environmental and Occupational Health (3 credits): This course examines the impact of macro-level trends – such as corporate globalization, immigration patterns, and technological development – on the urban physical environment. It focuses on the relationship between the urban infrastructure (e.g., housing, transportation, sewage and waste disposal) and environmental media (e.g., air quality, water quality and land use). This course also examines the impact of macro-level trends on occupational health and safety conditions, focusing on such issues as outsourcing of manufacturing jobs to developing nations, the rise in the service and informal economies, immigrant labor, de-unionization, the new working class and the loss of the safety net. It examines the effectiveness of current policies in addressing these problems. Through focused readings and in-depth examination of case studies, students develop the tools for analyzing how macro-social trends affect the urban physical environment, workplaces and health. Teams of students then analyze an environmental and occupational issue, illustrate how it affects urban communities, and develop solutions to reduce environmental and occupational health burdens.

- *Required for all EOH students*

PUBH 831 Environmental and Occupational Health Risk Assessment, Management and Communication in Urban Settings (3 credits): This course examines the development and use of Environmental and Occupational Health risk assessment and its policy implications as applied to urban settings. Approaches to assessing, communicating about and managing urban Environmental and Occupational Health risks are critically analyzed within their political, economic, social and cultural contexts. Risk assessment and risk management procedures are evaluated in light of several themes including public participation, sustainable development, environmental justice, and natural and technological hazards. Students conduct risk assessments on real world environmental and occupational health problems, develop effective written and verbal approaches to communicating the results of risk assessments, and critically review case studies in which Environmental and Occupational Health risk assessments have been used in setting public policy.

- *Required for all EOH students*

Health Policy and Management (HPM)

The HPM track prepares students for careers in research, teaching, policy analysis and organizational analysis in the broad fields of health services, health policy, and health management. Students will select a concentration in either Health Policy or Health Management. Students who choose Health Policy as a concentration will develop a nuanced understanding of how a range of mechanisms are systematically associated with policy and influence population health. Students who choose Health Management as a concentration will incorporate organizational theory and analysis in understanding how organizational structures, networks, and behavior influence the health of populations.

The HPM track will prepare graduates who can:

- Contribute to new knowledge about the mechanisms that influence the delivery of health services and public health programs and the development of health policy.
- Develop and manage initiatives to strengthen the functioning of health systems, health care organizations and public health agencies and programs.
- Develop, advocate for and implement health care and public health policies.
- Analyze the impact of health and non-health policies on population health.
- Teach students and professionals about the social determinants of health, health interventions, health policy, health management and health disparities.

Curriculum:
The core curriculum in HPM includes coursework in management and research methods. Electives are chosen in consultation with the faculty advisor.

Requirements for all HPM students:	
PUBH 840	Seminar in Health Policy and Management
PUBH 841	Quantitative Methods in Health Services Research
PUBH 842 (required for the 2014 cohorts and following)	Public Health Economics
PUBH 843 (required for the 2014 cohorts and following)	Health Policy Analysis Methods
Plus, cohorts preceding 2012	
Five electives: one of which must be from a Graduate Center program outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement), one leadership elective, one course in policy or management (economics, sociology, and political science); two research methods courses (one in economics or finance; one in research design, data analysis, econometric analysis, quantitative decision analysis, policy analysis, management, or practice).	
Plus, 2012 cohort and following	
Four advanced research methods or track-specific practice courses, one of which must be from a Graduate Center program outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement) and one must be a Health Economics course.	
Plus, 2014 cohort and following	
Three advanced research methods or track-specific practice courses, of which one must be from a Graduate Center department outside of Public Health (DPH courses that are cross-listed with another program can count toward this requirement).	

PUBH 840 Seminar in Health Policy and Management (3 credits): The objective of the course is to understand patterns in the organization, financing, and delivery of health care, and their relationship to population-based health outcomes, through an integrated exploration of research from the various disciplines informing the health policy and management fields. With an emphasis on the development of critical thinking skills, students are introduced to multidisciplinary models from the social sciences as conceptual sources for health policy and management research. The course adapts a transdisciplinary approach to the examination of important topics in urban public health management and policy, such as the relationship between health systems and the urban-based health economy, and the interface between managerial functions and health policy analysis in addressing health status and outcomes disparities.

- *Required for all HPM students*

PUBH 841 Quantitative Methods in Health Services Research (3 credits): This course focuses on quantitative reasoning skills in health services research within the context of the principles of the scientific method and the logic of the research process. The logic and methodologies of problem formulation, development of hypotheses and objectives, multidisciplinary research design, sampling, operationalization and measurement are reviewed in connection with selected analytic strategies, such as cross-section/time-series design, multilevel analysis, cost effectiveness analysis, and health impact assessment. Methodological connections between practice-based performance assessment for management and population-based health outcomes assessment for policy are addressed.

- *Required for all HPM students*
- *Prerequisite: PUBH 840*

PUBH 842 Public Health Economics (3 credits): The broad literature on health economics helps improve the understanding of issues related to public health and its influence in the decision-making process of cost-effective interventions for the overall population health. The emphasis of this class is on acquiring a set of devices from the economic theory and a framework within which to organize empirical analysis to inform health and public health policy. Topics will include the analysis of the overall health market, and in particular the analysis of the demand for health, health care and insurance, the supply of health care and insurance, the

market structure of the health care sector, and, finally, the positive and normative aspects of performance of the health care sector.

- *Required for the 2014 cohort and following*

PUBH 843 Health Policy Analysis Methods (3 credits): This course is designed to expand and deepen the analytic repertoire of students with respect to (1) the analysis of problems or issues that face health policy-makers; (2) the analysis of alternative solutions so those problems and (3) the evaluation of selected solutions (including doing nothing). The course uses research and analytic methods drawn from epidemiology, decision sciences, political science, sociology, social psychology and economics. It emphases how methods developed within these disciplines can be applied to policy analysis in public health and health care.

- *Required for the 2014 cohort and following*
- *Pre or Co-requisites PUBH 840 and PUBH 841*

Course Sequencing

* Required for the first exam § Has prerequisites † Has Pre or Co-requisites	Part time: 4 courses an academic year Full time: 7 courses an academic year

Requirements for all Tracks - 2014 Cohort and Following				
Course Number	**Course Title**	**Full Time**	**Part Time**	**Semester Typically Offered**
PUBH 800	Cities, Society and Health*	1st year	1st year	Fall
PUBH 801	Interdisciplinary Approaches to Urban Health Research*§	1st year	1st year	Spring
PUBH 805	Quantitative Research Methods with Applications to Urban Health*† (CSH, HPM, EOH)	1st year	2nd year	Fall
PUBH 806	Qualitative Research Methods with Application to Urban Health*	1st year	1st year	Spring
PUBH 820	Epidemiologic Methods I*	1st year	1st or 2nd year	Fall/Spring
The First Exam	Requirements to apply for the First Exam are marked with an*	1st year	2nd year	2 weeks before Fall Semester
PUBH 890	Advanced Research Seminar I§	2nd year	3rd year	Fall
PUBH 893	Public Health Leadership Development Seminar§	2nd year	3rd year	Fall
PUBH 807	Practicum Project§	2nd or 3rd year	3rd or 4th year	Fall/Spring
The Second Exam	Eligible after all coursework completed except PUBH 891, PUBH 898, and PUBH 900.	3rd or 4th year	4th or 5th year	Student's own schedule (~4-9 months)
PUBH 891	Advanced Research Seminar II§	3rd or 4th year	4th or 5th year	Fall/Spring
PUBH 898	Dissertation Seminar§	4th and 5th years	5th and 6th years	Fall/Spring
PUBH 900	Dissertation Supervision§	4th and 5th years	5th and 6th years	Fall/Spring

Requirements for CSH - 2014 Cohort and Following				
Course Number	**Course Title**	**Full Time:** 1st year - Two courses from this section for the first exam*	**Part Time:** 1st year - One course from this section for the first exam; 2nd year - A second course from this section for the first exam*	**Semester Typically Offered**
PUBH 810	Community Health Interventions†	1st or 2nd year	1st, 2nd, or 3rd year	Spring
PUBH 811	Social & Behavioral Dimensions of Health	1st year	1st year	Fall
PUBH 816	Evaluation of Public Health Programs and Policies	1st or 2nd year	1st, 2nd, or 3rd year	Fall
Four advanced research methods or track-specific practice courses, one of which one must be from a Graduate Center department outside of Public Health.		1st or 2nd year	1st, 2nd, or 3rd year	Fall/Spring

Requirements for EPI - 2014 Cohort and Following				
Course Number	**Course Title**	**Full Time:** 1st year - Two courses (in addition to PUBH 824) from this section for the first exam*	**Part Time:** 1st year - One course (in addition to PUBH 824) from this section for the first exam; 2nd year - A third course from this section for the first exam*	**Semester Typically Offered**
PUBH 821	Epidemiologic Methods II§	1st or 2nd year	1st or 2nd year	Fall
PUBH 822	Epidemiologic Methods III§	1st or 2nd year	1st or 2nd year	Spring
PUBH 823	Epidemiologic Methods IV§	2nd or 3rd year	3rd or 4th year	Fall
PUBH 824	Biostatistics I*	1st year	1st year	Fall/Spring
PUBH 825	Biostatistics II§	1st or 2nd year	1st, 2nd, or 3rd year	Fall
Three advanced research methods or track-specific practice courses, one of which one must be from a Graduate Center department outside of Public Health.		1st or 2nd year	1st, 2nd, or 3rd year	Fall/Spring

Requirements for EOH - 2014 Cohort and Following				
Course Number	**Course Title**	**Full Time:** 1st year - Two courses from this section for the first exam*	**Part Time:** . 1st year - One course from this section for the first exam; 2nd year - A second course from this section for the first exam*	**Semester Typically Offered**
PUBH 830	Emerging Issues in EOH	1st or 2nd year	1st or 2nd year	Every other Fall or Spring
PUBH 831	Environmental & Occupational Health Risk Assessment	1st or 2nd year	1st or 2nd year	Every other Fall or Spring
One Urban Environment course (3 credits)		1st or 2nd year	1st, 2nd, or 3rd year	Fall/Spring
Four advanced research methods or track-specific practice courses, one of which one must be from a Graduate Center department outside of Public Health.		1st or 2nd year	1st, 2nd, or 3rd year	Fall/Spring

Requirements for HPM - 2014 Cohort and Following				
Course Number	**Course Title**	**Full Time:** 1st year - Two courses from this section for the first exam*	**Part Time:** . 1st year - One course from this section for the first exam; 2nd year - A second course from this section for the first exam*	**Semester Typically Offered**
PUBH 840	Seminar in Health Policy and Management	1st or 2nd year	1st or 2nd year	Fall
PUBH 841	Quantitative Methods in Health Services Research§	1st or 2nd year	1st or 2nd year	Spring
PUBH 842	Public Health Economics	1st or 2nd year	1st or 2nd year	Spring
PUBH 843	Health Policy Analysis Methods†	1st or 2nd year	1st or 2nd year	Fall
Three advanced research methods or track-specific practice courses, one of which one must be from a Graduate Center department outside of Public Health.		1st, 2nd, or 3rd year	1st, 2nd, or 3rd year	Fall/Spring

Concentration in Nutrition

The Nutrition Concentration is open to students in any specialization track who have prior training in nutrition, food sciences or food policy. Students can learn more about the requirements and expectations of the concentration by consulting Professor Arlene Spark, Coordinator of the concentration, or their Track Coordinator. Students in the concentration are expected to complete four courses (12 credits) that meet both track and concentration requirements, i.e., no extra credits are required. PUBH 814 Food Politics and Policies or its equivalent; SOC 828 Food, Culture and Society or its equivalent; an advanced three credit epidemiology course relevant to nutrition (e.g., Nutritional Epidemiology; Chronic Disease Epidemiology, Life Course Epidemiology) and one three credit elective in research methods relevant to public health nutrition.

PUBH 814 Food Politics and Policies (3 credits): This is a policy course that examines the effects of the food industry and government on diet-related disease, and on health promotion and disease prevention. Most readings have a strong political content. Central themes include: government action versus individual liberty, the contradictions of government support and opposition to certain policies, the role of litigation, and the importance of institutions (e.g., bureaucracy, Congress, the media).

SOC 828 Food, Culture and Society (3 credits): This course explores major issues in foodways, focusing on preparation and consumption, through readings and discussions as well as through the development of a culturally-informed public health nutrition initiative and fieldwork exploring a specific cultural food tradition. Theoretical frameworks include the food voice, cultural studies, political economy, and symbolic interactionism. Materials are drawn from across the social sciences and applied to public health.

Concentration in Maternal, Child, Reproductive and Sexual Health

MCRSH is a key to the long-term health of individuals, families, communities and societies. Reproductive and sexual health problems -- such as unintended pregnancies, maternal death, sexually transmitted diseases (STDs), gender-related violence and others -- are still the leading cause of illness and death for women of childbearing age worldwide. Although infant and childhood mortality is declining overall, some regions of the developing world still face significant burdens. The MCRSH concentration is designed to provide students with a theoretical understanding of the social and historical context that shapes maternal, child, reproductive and sexual behaviors and health outcomes across the life-span; and with practical experience in research, programs and/or policies to reduce disparities and promote health. Students in the MCRSH concentration will take three MCRSH specific courses: two required courses (PUBH 870 and PUBH 871) and one MCRSH-related elective (9 credits total). The MCRSH specific courses will replace the elective requirements of the Community, Society and Health track; students in the Epidemiology, Environmental and Occupational Health, and Health Policy and Management tracks may seek a concentration in MCRSH if they take these three required courses in addition to their track specific elective requirements. Students completing the MCRSH concentration are further required to have an MCRSH focus to their (1) PUBH 807 Practicum Project (3 credits) (2) PUBH 890 Advanced Research Seminar I (3 credits), (3) PUBH 891 Advanced Research Seminar II (3 credits), and (4) their second exam and (5) their dissertation (PUBH 898 Dissertation Seminar (0 credits) & PUBH 900 Dissertation Supervision (0 credits)). Thus the MCRSH concentration within the DPH will require that 18 of the 48 (or 57 for non CHS students) credits plus the second exam and the dissertation be focused on MCRSH, providing a solid foundation in this area.

PUBH 870 Maternal, Child, Reproductive and Sexual Health in Context (3 credits): A critical overview of public health issues, approaches and concerns in the area of Maternal, Child, Reproductive and Sexual Health. Topics will include the medicalization of maternity care and infancy/childhood; the consequences of 'risk' as a dominant ideology for Maternal, Child, Reproductive and Sexual Health care; issues in reproductive justice, with particular attention to race and class, and the historic and contemporary influence of eugenics in public health; the history of midwifery and global trends in midwifery care; and the role of public health interventions in infant care; sexual health and gender identity.

PUBH 871 Maternal, Child, Reproductive and Sexual Health: A Life Course Perspective (3 credits): Provides a theoretical framework as to how life course exposures affect vulnerability to disease, with an emphasis on the roles of maternal, child, reproductive and sexual health. This course also considers how intra- and inter-generational influences may be relevant to disparities in health. Readings will address empirical patterns, prevailing theories and controversies regarding life course influences, as well as addressing interventions or policies that may be applied to improve population health.

- *Prerequisite: PUBH 820*

First Examination Guidelines

Content
The First Exam is intended to assess students' mastery of the core courses and their preparedness to advance in the program. The exam assesses the capacity to synthesize material and apply knowledge from these required courses to analyze current public health issues and come to well-reasoned conclusions.

Requirements to Apply
Successful completion of courses listed below or their equivalent, or registered in the course at the time of application:
PUBH 800 Cities, Society, and Health
PUBH 801 Interdisciplinary Approaches to Urban Health Research
PUBH 805 Quantitative Research Methods with Applications to Urban Health (PUBH 824 for EPI students)
PUBH 806 Qualitative Research Methods with Application to Urban Health
PUBH 820 Epidemiologic Methods I

Examination Frequency and Timing
The First Exam is offered once per year two weeks before the start of the Fall semester.

Examination Format
The First Exam follows a take-home format, and includes questions based on peer-reviewed articles that are provided to the student at the start of the exam. The exam focuses on the application of key DPH competencies and critical analysis of public health issues in three public health domains: (1) Theoretical Frameworks; (2) Methodological Frameworks; and (3) Research Methods. Students write three essays in response to three questions (one from each of the above three domains). Responses are expected to demonstrate critical analysis skills, in depth understanding of public health theory, research methods, clear writing skills, and, at times, knowledge of specific content areas. Students are expected to draw on content from core courses, as summarized in a First Exam reading list provided. The student's understanding should be expressed in depth in a well written and organized answer in which selected relevant information is thoughtfully presented with appropriate citations from the literature. All assertions of fact are to be documented with references to published, peer-reviewed literature.

Process and Procedures
Students are responsible for ensuring that the Application for Eligibility for First Exam for the Doctor of Public Health Program is reviewed, approved and signed by their Advisor and Track Coordinator. The application due date will be announced the semester prior to when the exam is to take place. The application for the First Exam is on Blackboard.

While students may prepare for the exam with other students, they are required to work completely independently without any collaboration after the exam is distributed. Students may refer to relevant class notes and reference materials when writing the answers to the examination questions. Reading lists for the first exam are updated annually.

Students have two weeks to complete and submit the exam. The instructions for the exam will include due date and time and required formatting. Students must submit an electronic version by the due date and time and a hard copy signed statement of academic integrity should be mailed or hand delivered to the DPH Office and arrive within a week of the electronic due date. Once the exam is made available, all students approved to take the exam must submit a completed exam by the due date and time. Failure to submit the exam by the due date and time will result in a failing grade for the entire exam. Students must keep a record of their sent e-mail in the event that there are any questions regarding the timing of submission.

The DPH Curriculum and Examinations committee appoints a DPH First Exam Committee, which oversees and coordinates all aspects of the First Exam administration, from selecting readings to developing answer keys to grading. Members of this Committee will include representation from each DPH Track. All questions regarding a specific First Exam should be directed to the First Exam Committee Chair.

Assessment & Grading

Exams will be coded with a unique identifier for anonymous grading. A first reader (inside the student's track) and second reader (outside of the student's track) will be designated for each exam. The APO is the only person who knows the pairings of student exams to exam readers. Readers will independently read and grade the exam. Ratings will be based on how well the student demonstrates a capacity to apply knowledge and skills gained in the required coursework and synthesize information. Each question will be rated using the following scale

> Satisfactory – adequate understanding of and written communication about the subject matter.
>
> Unsatisfactory – fundamental misunderstanding or inadequate mastery of or poor written communication about key concepts or principles; inadequate responses to the questions being asked on the exam; additional work needed to meet program expectations.

Satisfactory Responses

Responses to a given question on the First Exam that meet the above criteria will be judged "Satisfactory." Please be aware that for each answer that meets this standard, detailed feedback will not be given to the student.

Unsatisfactory Responses

<u>"Unsatisfactory" response to only one question on the First Exam:</u>

Students with answers that receive an "Unsatisfactory" rating from both readers for one answer will be given the opportunity to rewrite it within a 2-week period. For answers to a given question that receive an "Unsatisfactory" rating from only one of the two readers on one answer, a third reader will be asked to rate that answer. If the third reader also judges the response to be unsatisfactory, the student will be given broad feedback on the problems with their responses, and the opportunity to rewrite that answer within a 2-week period. Students will be allowed only one chance to rewrite an answer to a question that received an "Unsatisfactory" rating. Failure to rewrite the answer within the given timeline or the receipt of an unsatisfactory grade on the rewrite will result in a failure of the exam. Students who fall into this category must work with their Track Coordinator or a designee to develop a plan for preparing for a one-time retake the entire First Exam the next time it is offered, which must be approved by Track Coordinator and Executive Officer within one month of the notice of the unsuccessful completion of the First Exam. Students must pass all questions in the re-take exam; students will not be allowed to re-write any question from a retake examination. Students are allowed to retake the exam only once and students who fail even one question on the retake or do not retake the exam at the next offering of the first exam will be asked to withdraw from the program.

<u>"Unsatisfactory" responses to more than one question on the First Exam :</u>

Students who are given an "Unsatisfactory" rating on two or three responses by both readers (or by the third reader in the event that the first two readers give discrepant grades) will be allowed one opportunity to retake the First Exam at the time of the next scheduled administration of the exam. Students who fall into this category must meet with their Track Coordinator or a designee to receive broad feedback regarding the problems with their responses. They must then work with their Track Coordinator or a designee to develop a plan for preparing to retake the First Exam, which must be approved by the Track Coordinator and Executive Officer within one month of the notice of the unsuccessful completion of the First Exam. Students must pass all questions in a re-take exam; students will not be allowed to re-write any question during a retake examination. Students are allowed to retake the exam only once and students who fail even one question on the retake or do not retake the exam at the next offering of the first exam will be asked to withdraw from the program.

Second Examination Guidelines

The Second Examination Guidelines section consists of:

- Second Exam Overview
- The Second Exam in Relation to Coursework, Registration, Timeframe
- The Second Exam Committee – Roles and Responsibilities
- Assessment of the Second Exam Applying for the Second Exam – Checkpoints
- Developing the Reading List and Writing the Second Exam – Checkpoints
- The Second Exam Defense– Checkpoints

Second Exam Overview

The Second Exam assesses the student's preparation and readiness to engage in dissertation research. It also further lays the groundwork for the student's dissertation research. The Second Exam has both a written and an oral component. It examines mastery of theory, evaluation of empirical evidence, and advanced methods relevant to the student's track and future dissertation research.

The Second Exam in Relation to Coursework, Registration, Timeframe

Students work on the Second Exam only after successfully completing the First Exam and all required and elective courses, with the exception of PUBH 891 Advanced Research Seminar II, PUBH 898 Dissertation Seminar, and PUBH 900 Dissertation Supervision. In order to take PUBH 891 Research Seminar II, students need to have defended the Second Exam or, by permission of the instructor, have the defense scheduled to occur within the first two weeks of the semester. Students must then successfully defend the Second Exam within the first two weeks of the semester in order to continue the course.

In order to stay active in the program while working on the Second Exam, students should register for Weighted Instructional Units (WIUs). See page 8 for details.

There are no established times for Second Exam approval or defense. The timing depends on the approval process, as well as the readiness of the student and the availability of committee members. It may be challenging to secure availability of committee members during the winter or summer breaks, and students should inquire about availability during those times, as well as upcoming sabbaticals, in advance and plan accordingly.

The Second Exam Committee – Roles and Responsibilities

The Second Exam committee consists of 3 members: Sponsor, Reader and Chair. Committee members must be approved by the Track Coordinator and the Executive Officer via the Second Exam application (found on Blackboard). All Second Exam Committee members must be members of the DPH Faculty. However, with adequate justification, requests for an exception may be made in writing to the Track Coordinator and Executive Officer.

Sponsor

The Sponsor (who may or may not be the student's Academic Advisor) is a DPH faculty member who works most closely with the student in preparing the Second Exam application and reading list and in developing a mature draft of the exam. The student and Sponsor discuss possible committee members, and these members are approached and invited to the committee by the Sponsor (not the student). The Sponsor works with the student to develop a working target date for the final submission of the written component of the exam. The Sponsor must approve the final readings list, and work closely with the student as s/he develops the written exam, approving the mature draft of the Second Exam before it is shared with t the Reader and Chair. Students should expect to work through a number of drafts before the written second exam is deemed ready for the oral defense. The Sponsor should be from the same Track as the student (unless otherwise requested by the student to the TC and approved by the EO) and serves as the primary liaison with the other committee members. If the Sponsor is not from the same Track as the Student, then the Reader must be, with no exceptions.

Reader

The preliminary reading list, developed by the Sponsor and Student, is submitted to the Reader who is a DPH faculty member and will provide feedback and approve the final reading list. The Reader and Chair are responsible for providing written feedback to the student on a mature draft (read and approved by the Sponsor) of the Second Exam. The Student works with the Sponsor to incorporate revisions accordingly, and the Sponsor approves a near final draft with revisions to be shared with the Reader and Chair. The Reader and Chair review the revised draft, provide feedback to the student as needed until they, together with the Sponsor, approve the revised Second Exam as 'defense-ready'. Once the Committee has approved the revised Second Exam as "defense ready", it is disseminated to the committee in its final format and a defense date scheduled. The timeline for the defense will allow 4 weeks for the committee to read the final version of the Second Exam prior to the defense. The Reader must be from the same Track as the student (unless otherwise requested by the TC and approved by the EO). If the Reader is not in the same track as the student, the Sponsor must be, with no exceptions. In rare instances the Reader may be from outside the DPH Program or CUNY, but this must be justified by the Sponsor and approved in advance by the Track Coordinator and Executive Officer.

Chair

The Chair is a DPH faculty member who schedules and runs the defense meeting, is responsible for ensuring that all procedures are properly followed, presides over deliberations regarding the final outcome, and communicates the final outcome of the defense to the APO, Track Coordinator, and Executive Officer. The Chair must approve the final reading list, and, along with the Reader, is responsible for providing written feedback to the student on a mature draft (read and approved by the Sponsor) of the written component of the Second Exam before the defense, and for reading the final version of the Second Exam prior to the defense.

Assessment of the Second Exam

Each committee member will rate the written and oral components based on the following:

Excellent – Clearly written, demonstrates mastery of subject matter, critical thinking abilities, concise synthesis and analysis of the literature. Ready to proceed to independent dissertation research.

Satisfactory – Clearly written, adequate understanding of subject matter and critical analysis and synthesis of the literature, with expectation that student will hone specific areas in order to be better prepared to commence independent dissertation research.

Unsatisfactory – Does not demonstrate understanding of subject matter and critical thinking abilities. Does not appear ready to commence independent dissertation research.

Applying for the Second Exam – Checkpoints

Student:

- Identify a Second Exam Sponsor by consulting with their Academic Advisor, tracking research activities of faculty working in areas of interest of the student, and meeting with faculty to explore possibilities for dissertation research.
- Discuss in detail the possibilities and work with the Sponsor to develop a draft, one page description of the planned dissertation research and Second Exam topic areas (see next bullet).
- Apply for the Second Exam by submitting a completed Application for Eligibility for Second Exam (found on Blackboard). Along with the application, students must submit a one page description of the planned dissertation background, topics/research questions, and methods (recognizing that these may be evolving) as well as a one page description about how the two topic/content areas and two methodological topics will feed into and support the planned dissertation research, to their Second Exam Sponsor.

Sponsor:

- Accepts the request to act as the Sponsor, and works closely with the student, serving as the primary liaison with the other committee members for the student's Second Exam.
- Approaches the Reader and Chair to invite them to act in those roles for student's Second Exam.
- Critically reviews and approves the student's Second Exam application and one page description.

Reader:

- Accepts Sponsor's request to act as the Reader for the Student's Second Exam.
- Critically reviews and approves the student's Second Exam application and one page description.

Chair:

- Accepts Sponsor's request to act as the Chair for the Student's Second Exam.
- Critically reviews and approves the student's Second Exam application and one page description.

Other:

- Track Coordinator reviews and approves the student's Second Exam application and one page description.
- Executive Officer reviews and approves the student's Second Exam application and one page description.

Developing the Reading List and Writing the Second Exam – Checkpoints

Student:

- Once the Second Exam application has been approved, the student has the primary responsibility for developing a preliminary reading list that covers two public health-related content areas and two relevant methodological areas that will support the proposed dissertation research. From the date the student's reading list is approved, it is expected that the Second Exam will take from 4 to 9 months to complete. If 9 months pass and no substantive progress has been made in completing the written portion of the exam, the student must submit another Application for Eligibility for Second Exam.
- The written component of the Second Exam comprises of a critical literature review of two substantive public health-related topic areas and two methodological topic areas relevant to the student's planned dissertation research. The exam should include a summary and analysis of the peer-reviewed literature and current state of knowledge in the particular area, a discussion of gaps in knowledge, and important areas for future research. When possible, the four topic areas should be related to each other (i.e. the discussion of the literature highlights a common methodological approach, or a methodological weakness or gap, which is then discussed in more detail in the methodological area potion of the exam that covers what the method is, its strengths and weaknesses, and how this method has been or could be applied to the topic areas). The Second Exam is intended to serve as a foundation for the dissertation proposal, but is often broader in scope than a specific dissertation topic and includes discussion of related theories and empirical evidence that sets a general context for the dissertation research area.
- The student revises the written component of the second exam to incorporate feedback from the Sponsor, and later the other committee members. Students should expect to work through a number of drafts with the Sponsor before the written exam is deemed ready to disseminate to other committee members.
- The penultimate draft and final version of the written component of the exam must be no more than 20 double-spaced pages, excluding references, figures, and tables.
- The student submits the Second Exam Progress report to the Sponsor every two months during this process.
- The Student works with the Sponsor by sharing detailed responses to committee member comments, and incorporate revisions accordingly. The Sponsor must approve a near final draft with revisions to be shared with the Reader and Chair for their comments.
- The Reader and Chair review the Sponsor-approved revised draft, and provide feedback to the student as needed until they and the sponsor approve the revised Second Exam as 'defense-ready'. Once the Reader has approved the revised Second Exam, it is disseminated to the committee as a whole and a defense date scheduled at least 4 weeks later.
- During the entire process, the student prepares for the oral defense, which can include questions from the approved reading list and any other reading list provided by the student's Track Coordinator (e.g., general readings for the discipline) at the time of Second Exam approval.
- The student prepares a 10-15 minute presentation for the Second Exam defense, and practices the presentation, ideally in front of others in a position to provide feedback, to ensure a clear, comprehensive, and concise delivery.
- The student informs the DPH Program of any special audiovisual needs beyond PowerPoint projection at least one week in advance of the defense
- The student brings hard copies of the slides for committee members on the day of the defense.

Sponsor:

- Works with the student on setting a realistic timeframe for completion of the exam.
- Reviews and submits bi-monthly Second Exam Progress reports to the TC and EO.
- Reviews, provides input on, and approves the Reading List, working drafts, and mature drafts of the Second Exam before sharing with Reader and Chair.
- Works with student to address comments of Sponsor, Reader, and Chair.

- Works with student to prepare the Second Exam Defense presentation.
- Critically reviews the final written portion of the Second Exam in advance of the defense, and comes to the defense with an initial rating of the written component (Excellent, Satisfactory, Unsatisfactory) along with supporting information and questions.

Reader:

- Provides feedback on and approves final Reading List.
- Provides written feedback on mature, sponsor-approved draft.
- Works with student to ensure comments of Sponsor, Reader and Chair are adequately addressed, ultimately approving a final draft as 'defense ready.'
- Critically reviews the final written portion of the Second Exam in advance of the defense, and comes to the defense with an initial rating of the written component (Excellent, Satisfactory, Unsatisfactory) along with supporting information and questions.

Chair:

- Approves the final Reading list.
- Provides written feedback on a mature draft.
- Critically reviews the final written portion of the Second Exam in advance of the defense, and comes to the defense with an initial rating of the written component (Excellent, Satisfactory, Unsatisfactory) along with supporting information and questions.
- Communicates with the committee about when the exam is ready for defense, schedules the defense data for no less than 4 weeks following receipt of the final revised document and requests a room for the defense from the APO.

Other:

- At the time of the Second Exam application approval, the Track Coordinators may supplement the student's reading list with the intention to guide the student in theory and methods.
- The APO will schedule a room with standard A/V equipment.

The Second Exam Defense– Checkpoints

Student:
The student is responsible for both the written content of the Second Exam as well as any material included on general supplemental readings that may be provided by each Track.

Sponsor:

- The Sponsor has worked closely with the student on the entire Second Exam.
- Critically reviews the final proposal in advance of the defense, and comes to the defense prepared with comments and questions.

Reader:

- The Reader has given feedback on and approved the Reading List, provided feedback on mature drafts and ensured the final version is 'defense ready'.
- Critically reviews the final proposal in advance of the defense, and comes to the defense prepared with comments and questions.

Chair:

- The Chair has approved the Reading List, provided feedback on a mature draft and ensured the final version is 'defense ready'. The Chair communicates with the committee and when all agree that the written exam is defense ready, s/he schedules the defense date (at least 4 weeks after the student has submitted the final, committee approved draft) and requests a room from the APO.
- Critically reviews the final proposal in advance of the defense, and comes to the defense prepared with comments and questions.
- The Chair presides over the Second Exam Defense and reports the outcome to the student and the DPH Program (TC, EO and APO).

Second Exam Defense Process

1. The defense should last approximately 2 hours.

2. All committee members and the student are expected to arrive on time, turn off mobile devices, and remain in the room for the duration of the defense.

3. Immediately prior to the defense, the Committee will convene briefly and the Chair will check if there are any outstanding issues, describe the defense process and assign the order of the questioning. The Sponsor has the option of choosing to be the first or last questioner.

4. The student makes a brief summary presentation (s/he may present slides if helpful). Since all committee members will be intimately familiar with the content of exam by this point, this presentation should be 10-15 minutes in length, and in no cases should it be more than 20 minutes.

5. All committee members should be given the opportunity to pose questions to the student on the content of the written exam as well as general theory and methods questions related to the student's disciplinary Track.

6. The student responds to questions posed by the committee members.

7. Immediately following the presentation, questions and discussion, the Chair asks the student to step out of the room and the committee members come to a consensus on an overall grade of *excellent*, *satisfactory* or *unsatisfactory*, which is based on each faculty member's initial critical review of the written component and the student's oral defense. In the event that a student receives a grade of unsatisfactory on the exam, an ad hoc faculty committee will be formed by the EO to discuss the student's continuation in the program. This committee may decide to require that the student take additional coursework or complete other work before retaking the Second Exam, or the committee may request that the student withdraw from the Program. Students may be allowed to retake the Second Exam only once. If they do not pass the retake of the Second Exam, the student will be asked to withdraw from the Program.

8. The Chair reports to the outcome of the Second Exam defense to the student, the TC, the EO, and the APO.

Dissertation Guidelines

The Dissertation Guidelines section consists of:

- The Dissertation in Relation to Coursework, The Second Exam, Registration, Levels, and Records
- The Dissertation Committee – Roles and Responsibilities
- Preparation of the Dissertation Proposal - Checkpoints
- Dissertation Proposal Defense - Process
- Guidance on the Three Article Dissertation Model
- Guidance on the Traditional Dissertation Model
- Dissertation Review, Approval, and Preparation for the Defense - Checkpoints
- Dissertation Defense – Checkpoints
- Dissertation Defense - Process

After completing all coursework and exams, students complete an original dissertation research project.

The Dissertation in Relation to Coursework, The Second Exam, Registration, Levels, and Records
Within the first year of coursework, students should discuss possible dissertation topics and research questions with their advisor and other faculty members. By the end of the first year of coursework, students should have possible research topics and research questions identified. And by the end of PUBH 890 Advanced Research Seminar I, students should have made substantial progress toward identifying a topic, research questions, possible methods, and source of data for the dissertation (i.e. planned self-collection, a publicly available data source, or data from the research study already conducted by the student, a faculty member, student's workplace, or some other source). In identifying potential data for the dissertation, students might consider some of the publicly available data sources which are included on a list posted on BlackBoard.

Once an area and initial research questions are selected, students should determine if the appropriate data can be acquired and if s/he has the requisite research skills to analyze the data correctly or can gain the expertise to do so. As each student's dissertation is unique, it is not possible for the required Program coursework to cover every research method that might be used for a dissertation and students are expected to plan their elective courses, independent studies, and even include additional coursework or training aimed at preparing themselves for their independent dissertation research and associated analytic techniques they are planning to employ in order to successfully complete the dissertation.

In PUBH 891 Advanced Research Seminar II students will refine the dissertation proposal. Students are required to complete and submit the annual Dissertation Progress Report annually (with review and approval by the sponsor) by the second week of the spring semester of each year until the dissertation is successfully defended and deposited.

Students must complete all coursework, pass the First and Second Exams, identify a Dissertation Sponsor, and convene a dissertation committee approved by the Track Coordinator before registering for PUBH 900 Dissertation Supervision and PUBH 898 Dissertation Seminar. PUBH 900 Dissertation Supervision and PUBH 898 Dissertation Seminar are non-credit required course numbers that students must be registered for every semester they are working on the dissertation. The student must be registered for PUBH 900 and PUBH 898 in the same or preceding semester that the student deposits the dissertation.

Students can only be advanced to Level III after the completion of all coursework, passing the First and Second Exams, and defending their dissertation proposal. See page 7.

The name of the student as noted on the dissertation to be deposited must match that of the name in Banner. If a student wishes to change name of record with the GC, they should request a change of name form from the Registrar's Office and submit that along with supporting documentation well in advance of the defense and dissertation deposit dates.

Upon depositing the dissertation, the student must show evidence that their record has been cleared by the Bursar, the Registrar, the Office of Financial Aid, the Director of the Office of International Students (if applicable), and the Mina Rees Library at the Graduate Center.

The Dissertation Committee – Roles and Responsibilities

The Dissertation Committee consists of four to five people: Sponsor, First Reader, Chair, Outside Reader, and an optional Third Reader. The roles must each be held by a different person (one person cannot fill more than one role on the committee). In no circumstances shall both the Sponsor and the First Reader be from outside the student's Track. The Track Coordinator, in consultation with the Executive Officer, makes the final decision on all committee member appointments and changes.

The members of the dissertation committee usually serve from the proposal stage through the dissertation defense. In situations when changes need to occur, the Sponsor must request and the TC and EO must approve any replacement committee members.

Sponsor

The Sponsor is a DPH faculty member who has prior experience serving on dissertation committees, expertise in the student's interest area and must be from the same disciplinary Track as the student. The student must negotiate a dissertation research project that the Sponsor agrees to supervise. The Sponsor is the faculty member who works most closely with and mentors the student to guide research content, study design and conduct, data analysis, writing, interpretation of results, and help to foresee and solve problems. When a student registers for PUBH 900 Dissertation Supervision, they do so under their Sponsor's name. The Sponsor will identify and recruit other dissertation committee members, usually in consultation with the student. The Sponsor is responsible for providing feedback on early drafts of the proposal and dissertation, approving the draft that is provided to the First Reader. The Sponsor also works with the Student to manage any revisions to the dissertation proposal and the dissertation itself requested by other committee members. The Sponsor cannot be on sabbatical while sponsoring a student. In this instance, an appropriate 'back-up' Sponsor must be identified well in advance and submitted by the Sponsor for approval by the TC and EO. The sponsor may continue to advise the student in an unofficial capacity or officially by taking-on a different role in the committee (e.g. the sponsor and another committee member may switch roles during the sabbatical).

First Reader

The First Reader is a DPH faculty member who must be from the same disciplinary Track as the student. S/he often reads several mature drafts of the proposal and dissertation, providing comments on the aims, design, and analytic approaches, The First Reader must read and provide thorough feedback on the first full Sponsor-approved draft of the proposal and dissertation in addition to the final versions but may provide comments on drafts between these two versions as well if needed. The First Reader, in consultation with the Sponsor, must approve the dissertation proposal and dissertation as 'Defense Ready' prior to circulating it to other committee members.

Chair
The Chair is a senior member of the DPH faculty (professor or associate professor) with experience in dissertation committee membership and student sponsorship, and is from the same Track as the student. The Chair will read and give feedback on Sponsor and First Reader approved drafts of the dissertation proposal and the dissertation at least once prior to each defense. He or she also oversees the process, convenes meetings, including the defense itself, and works to resolve any differences that might arise in the committee. The Chair presides over the dissertation proposal defense and dissertation defense, and reports on the outcome of the defense to the APO, Track Coordinator, and Executive Officer.

Outside (Second) Reader
The Outside Reader cannot be a DPH program faculty member. The outside reader may be a faculty member appointed to any other CUNY program, University, or from a professional organization or agency. The Outside Reader will provide specific expertise and quality control and will review the Sponsor and First Reader approved drafts of the proposal and dissertation and provide at least one round of feedback before the defense is scheduled. All outside readers must have demonstrated training, experience, and capability of rigorously evaluating research in the student's discipline. A CV of the outside member must be reviewed by the Sponsor and approved by the Track Coordinator and EO prior to their committee appointment.

Optional (Third) Reader
The optional Fifth Member can be either a DPH faculty member or from outside the DPH program or CUNY. The optional Third Reader will provide specific expertise and quality control and will review the Sponsor and First Reader approved drafts of the proposal and dissertation and provide at least one round of feedback before the defense is scheduled. Prior to the committee appointment, rationale for the appointment of a Third Reader must be provided to the TC and EO, along with a recent CV.

Preparation of the Dissertation Proposal - Checkpoints

Overview:

1) The Student works closely with the Sponsor to develop a comprehensive and polished draft of the dissertation proposal.
2) With the Sponsor approval, this draft is then shared with the First Reader who provides feedback and works with the student in consultation with the Sponsor to ensure that any additional comments are addressed.
3) Then, with First Reader approval, the proposal is circulated to the entire committee by the student and the committee is given 4 weeks within which they must provide written feedback to the student.
4) The Chair contacts the committee members to see if there is agreement that the proposal is ready for defense, if not, the student addresses comments and circulates the next draft to the entire committee (until the committee agrees it is ready for defense). Once the committee agree the proposal is ready for defense,
5) the Chair schedules the defense.

There are no established times for the dissertation proposal defense. The timing depends on the readiness of the student and the availability of committee members. It may be challenging to secure availability of committee members during the winter or summer breaks, and students should inquire about availability during those times, as well as upcoming sabbaticals, in advance and plan accordingly.

Roles of the Student, Sponsor, and other Dissertation Committee members

Student:

- Prior to finalizing the proposal, the student must complete the online CUNY's Responsible Conduct of Research (RCR) training . This is not mandatory for soon to deposit/defend candidates, however newer cohorts should anticipate having to complete this training as part of PUBH 891 Advanced Research Methods II.
  http://www.cuny.edu/research/compliance/Responsible-Conduct-of-Research.html
- After the proposal defense, the student completes, signs and submits GC Human Participants Clearance Form, dissertation abstract, and IRB approval or exemption to Nichol Gallimore at ngallimore@gc.cuny.edu.
  All questions regarding the GC Human Participants Clearance Form should be directed to Nichol Gallimore.
  http://www.gc.cuny.edu/CUNY_GC/media/CUNY-Graduate-Center/PDF/Research%20Funding/dissertation-form-letter_v2_1.pdf
  Please also review The CUNY Human Research Protection Program (HRPP) which comprises of 5 University Integrated Institutional Review Boards (IRBs) and 19 on-site HRPP offices.
  http://www.cuny.edu/research/compliance/human-subjects-research-1.html
- The student updates, submits and reviews the annual Dissertation Progress Report (found on Blackboard) with the Sponsor. The report must be approved by the Sponsor and submitted to the Track Coordinator by the second week of each spring semester until the dissertation is deposited.
- The Student prepares drafts of the dissertation proposal in the NIH format (see below) and shares with the Sponsor for review, input/feedback, and discussion.
- The Student may consult with other committee members regarding aspects of the proposal as it is under development.
- A mature, Sponsor-approved, full draft of the proposal is shared with the First Reader for review, input/feedback, and discussion. The student allows at least 4 weeks for review.

- The Student works with the Sponsor and First Reader to incorporate comments, suggestions, and feedback into a mature draft until it is approved by the First Reader, in consultation with the Sponsor.
- The First-Reader approved draft is then circulated to the entire committee for their review, input/feedback, and discussion. The student allows at least 4 weeks for review.
- All comments are shared with the Sponsor and First Reader for review and discussion. The student prepares responses to all major comments and reviews them with the Sponsor and First Reader.
- Additional revisions may be necessary, and the Sponsor and/or First Reader may recommend that the full committee review additional drafts. The Sponsor and First Reader work with the Student to revise the proposal accordingly.
- The Student must ensure that the proposal adheres to content and format guidelines below, including font size, line spacing, and page limits.
- Once the committee, approves the revised proposal (communicated to the Chair) as 'defense ready', the final proposal may be circulated to the full committee and a proposal defense date scheduled, allowing at least 4 weeks for review and identifying a day/time when all committee members can be present. The student prepares a 10-15 minute presentation for the Dissertation Proposal Defense, and practices the presentation, ideally in front of others in a position to provide feedback, to ensure a clear, comprehensive, and concise delivery.
- The student informs the DPH Program's APO of any special audiovisual needs beyond PowerPoint projection at least two weeks in advance of the defense.
- The student brings hard copies of the slides for committee members on the day of the defense.

Sponsor:

- Meet with the student regularly, review and provide input and guidance on all aspects of proposal development.
- Provide written feedback on all drafts of the proposal. Note that it is common for the proposal to go through multiple drafts before the Sponsor approves circulation of a full and mature draft to the First Reader.
- Review and ensure that the comments and revisions from all committee members are received and adequately considered and addressed as appropriate by the student.
- Approve mature draft of proposal for sharing with the First Reader.
- Consult with the First Reader on Student's proposal development progress and readiness to circulate to other committee members as needed.
- Critically review the final proposal in advance of the defense, and come to the defense prepared with comments and questions.

First Reader:

- Provide written feedback on full, mature, Sponsor-approved drafts of the proposal. Note that it is common for the proposal to go through multiple revisions before the First Reader approves circulation to the larger Dissertation Committee.
- Consult with the Sponsor on Student's proposal development progress and readiness to circulate to other committee members as needed.
- Critically review the final proposal in advance of the defense, and come to the defense prepared with comments and questions.

Chair:

- Provide written feedback on a mature, First-Reader approved draft.
- Communicates with committee members to determine when the proposal is ready for defense and a defense date can be scheduled.
- Schedules the defense, communicates with the APO to identify a room for the defense, and notifies the committee and student of the date and location for the defense.

- The Chair works with the Student and/or Committee Members as needed to resolve outstanding issues that cannot be resolved by the Student and the Sponsor or other committee members.
- Critically review the final proposal in advance of the defense, and come to the defense prepared with comments and questions.
- The Chair presides over the proposal defense and reports the outcome to the TC, EO and APO.

Outside (Second) Reader(s):

- The Outside Reader (and optional Third Reader) provide specific expertise and quality control.
- Provides written feedback on a mature, First-Reader approved draft. Critically review the final proposal in advance of the defense, and come to the defense prepared with comments and questions.

APO

- The APO will schedule a room with standard A/V equipment upon request from the Chair and student.

Dissertation Proposal Format

The dissertation proposal is a detailed plan that describes the content and methods of the planned dissertation. It is to be prepared in the NIH proposal format (below) and will include a statement of the problem, aims and research questions, a brief summary of relevant literature that explains the background and significance of the topic and describes the gaps that will be addressed by the dissertation, describes in some detail the study design, data sources, methods of data collection, and data analysis methods. Students are expected to describe and explain the theoretical framework for the study and include a power or sample size calculation for all quantitative analyses. The methods proposed should be both rigorous and feasible as it relates to achieving the aims and answering the proposed research questions as definitively as possible without major limitations that undermine or threaten the validity of the proposed research. The proposal should include a thorough description of the strengths and limitations of the proposed approach and a realistic timetable for completing the dissertation. It must also address human subjects issues related to your proposed research.

Elements of a Dissertation Proposal in the NIH format
Students should use the full 13 pages for their dissertation proposal, but no more than 13 pages.

1. Specific aims (1 page, single spaced)

2. Research Plan (12 pages, single spaced not including Human Subjects, citations and appendices)

    2.a. Background and significance, with 1 paragraph conclusion (no more than 2 pages)
    2.b. Innovation (about half a page)
    2.c. Approach (about 9.5 pages)

        2.c.1. Conceptual/Theoretical Framework w/ diagram (about 1 page)
        2.c.2. Preliminary data (if applicable, no more than half a page)
        2.c.3. Research design (6-7 pages, must address all proposal aims)
        2.c.3.1. Study design
        2.c.3.2. Study population and eligibility criteria (about 1-2 paragraphs)
        2.c.3.3. Data sources, collection, and management (about 1 page)
        2.c.3.4. Sampling/Recruitment procedures (if applicable)
        2.c.3.5. Primary and secondary outcome definitions
        2.c.3.6. Data analysis plan for each proposal Aim (i.e., statistical analysis/modeling or qualitative analysis)
        2.c.3.7. Statistical power and sample size for each Aim (if applicable, no more than half a page)

    2.d. Study timeline (1 paragraph or table)
    2.e. Generalizability (1 paragraph)
    2.f. Limitations and threats to the validity of the proposed research and how they will be managed (1 page)

3. Human Subjects (no page limit). For instructions, review Part II of NIH's Supplemental Instructions for Preparing the Protection of Human Subjects Section of the Research Plan.

4. Citations

5. Appendices (may include draft data collection instruments)

Dissertation Proposal Defense Process

1. The proposal defense should last approximately 2 hours.

2. All committee members and the student are expected to arrive on time, turn off mobile devices, and remain in the room for the duration of the defense.

3. Immediately prior to the defense, the Committee will convene briefly and the Chair will check if there are any outstanding issues, describe the defense process and assign the order of the questioning. The Sponsor has the option of choosing to be the first or last questioner.

4. Once the Committee and Student are assembled, the student gives a 10-15 minute formal presentation of the proposal (slides may be presented if desired). Since all committee members will be intimately familiar with the content of the proposal by this point, this presentation should be 10-15 minutes in length, and in no cases should it be more than 20 minutes.

5. Each committee member will ask questions and give feedback for approximately 15-20 minutes each.

6. The Chair will facilitate a discussion of the proposal.

7. Immediately following the presentation and discussion, the Chair asks the student to step out of the room and the committee members come to a consensus on the outcome of the proposal defense. The possible outcomes are: 1. Pass with no or minor revisions; 2. Pass with major revisions; 3. Failed. In the event of minor revisions, only the Sponsor must approve the revised dissertation proposal. In the event that major revisions are required, both the Sponsor and the First Reader must approve the revised dissertation proposal. In the event of a failed dissertation proposal defense, an ad hoc faculty committee will be formed by the TC and EO to develop a course of action.

8. The Chair will report the outcome of the proposal defense to the Track Coordinator, APO, and EO.

9. Final approved dissertation proposals must be submitted to the DPH Program office in PDF format by the Student for archival purposes.

Dissertation Preparation, Review, Approval, and the Dissertation Defense Process - Checkpoints

Overview:

1) The Student works closely with the Sponsor to develop comprehensive and polished drafts of individual dissertation chapters or manuscripts.
2) With the Sponsor's approval, draft chapters or manuscripts are then shared with the First Reader who provides feedback and works with the student in consultation with the Sponsor to ensure that any additional comments are addressed.
3) Then, with First Reader approval, individual dissertation chapters are circulated to the entire committee by the Student and the committee is given at least 3 weeks within which they must provide written feedback to the student on individual dissertation chapters.
4) The Student reviews comments with the Sponsor and incorporates revisions accordingly.
5) Revised, individual chapters are approved as 'Defense-ready' by the committee and communicated to the Chair (who notifies the Sponsor).
6) The Final Dissertation with all chapters is reviewed by the Sponsor and First Reader, and approved by both prior to circulation to the full committee, allowing 4 weeks for review and feedback.
7) Comments from the full committee are addressed, in consultation with the Sponsor and First Reader and upon approval by the Sponsor and First Reader, the Final Full Dissertation is disseminated to the full committee and a defense date is scheduled, allowing at least 4 weeks before the defense to allow time for all committee members to review the dissertation in its entirety.

There are no established times for the dissertation defense. The timing depends on the readiness of the student and the availability of committee members. It may be challenging to secure availability of committee members during the winter or summer breaks, and students should inquire about availability during those times, as well as upcoming sabbaticals, in advance and plan accordingly.

Student:

- The student updates, submits and reviews the annual Dissertation Progress Report (found on Blackboard) with the Sponsor. The report must be approved by the Sponsor and submitted to the Track Coordinator by the second week of each spring semester until the dissertation is deposited.
- The Student, in consultation with the Sponsor, chooses a dissertation format (3 paper model or traditional dissertation).
- The Student prepares drafts of individual dissertation chapters and shares with the sponsor for review, input/feedback, and discussion.
- The Student may consult with other committee members regarding aspects of the dissertation as it is under development.
- Mature, Sponsor-approved, full draft of individual chapters are shared with the First Reader for review, input/feedback, and discussion. The student allows at least 3 weeks for review of each chapter.
- The Student works with the Sponsor and First Reader to incorporate comments, suggestions, and feedback into a mature drafts of individual chapters that are approved by the First Reader, in consultation with the Sponsor.
- The First-Reader approved drafts of individual chapters are then circulated to the entire committee for their review, input/feedback, and discussion. The student allows at least 3 weeks for review.
- All comments are shared with the Sponsor and First Reader for review and discussion. The student prepares responses to all major comments and reviews them with the Sponsor and First Reader.
- The Student works with the Sponsor to address and incorporate all comments. A mature, Sponsor-Approved revised draft of each chapter is provided to the First Reader for their review, input/feedback,

discussion, and assessment of responsiveness to the committee's comment. The student allows at least 3 weeks for review.

- Additional revisions may be necessary, and the Sponsor and/or First Reader may recommend that the full committee review additional drafts of individual chapters. The Sponsor and First Reader work with the Student to revise the chapters accordingly.
- Once the committee has approved the individual chapters as defense ready (communicated to the Chair who informs the Sponsor), a full dissertation is developed with all chapters included for review by the Sponsor. This draft has incorporated and/or addressed all comments received by all committee members to date. The student incorporates final comments and edits from the Sponsor. A Sponsor-approved, full dissertation is then shared with the First Reader, allowing at least 4 weeks for review.
- Prior to circulating the full dissertation to the First Reader, the Student must ensure that the dissertation adheres to all content and format guidelines.
- Once the First Reader, in consultation with the Sponsor, approves the full dissertation as 'defense ready', the penultimate version of the full dissertation may be circulated to the full committee, allowing at least 4 weeks for review.
- Comments from the full committee are reviewed and incorporated by the student, in consultation with the Sponsor and First Reader. Once the Sponsor and First Reader determine that the feedback has been adequately addressed/incorporated by the student in a Final Full Dissertation, it may be circulated to the full committee, allowing at least four weeks for review prior to the scheduled defense date.
- The student prepares a 10-15 minute presentation for the Dissertation Defense, and practices the presentation, ideally in front of others in a position to provide feedback, to ensure a clear, comprehensive, and concise delivery.
- The student informs the DPH Program's APO of any special audiovisual needs beyond PowerPoint projection at least two weeks in advance of the defense.
- The student brings hard copies of the slides for committee members on the day of the defense.

Sponsor:

- Meet with the student regularly, review and provide input and guidance on all aspects of dissertation development.
- Provide written feedback on all drafts of dissertation chapters and the full dissertation. Note that it is common for dissertation chapters to go through multiple drafts before the sponsor approves circulation of a full and mature draft to the First Reader.
- Review and ensure that the comments and revisions to dissertation chapters from all committee members are received and adequately considered and addressed as appropriate by the student.
- Approve mature drafts before sharing with First Reader.
- Consult with the First Reader on Student's dissertation progress and readiness to circulate to other committee members as needed.
- Consult with the Chair on the readiness of the dissertation chapters for combining into the full dissertation.
- Work with the student to prepare the full dissertation, providing comments and feedback, and approve it for review by the First Reader.
- Work with the student to ensure committee comments on the full dissertation have been addressed.
- Critically review the final, full dissertation in advance of circulation for the defense, and come to the defense prepared with comments and questions.

First Reader:

- Provide written feedback on full, mature, Sponsor-approved drafts of individual dissertation chapters as well as the full dissertation. Note that it is common for dissertation chapters to go through multiple revisions before the First Reader approves circulation to the larger Dissertation Committee.
- Consult with the Sponsor on Student's dissertation progress and readiness to circulate chapters to other committee members as needed.
- The First Reader must approve the Final Full Dissertation as Defense-ready prior to scheduling the Dissertation Defense.
- Critically review the final dissertation in advance of the defense, and come to the defense prepared with comments and questions.

Chair:

- Provides written feedback on a mature First-Reader approved drafts of individual chapters as well as the full dissertation.
- The Chair works with the Student and/or Committee Members as needed to resolve outstanding issues that cannot be resolved by the Student and the Sponsor or other committee members.
- Communicate with committee members about their views on whether drafts of chapters and the first draft of the full dissertation will be ready for defense once comments have been addressed (or if the committee wants to see additional drafts).
- At least a month in advance of the defense , the Chair schedules the dissertation defense, requests a room for the defense from the APO, and communicates the date and location of the defense to the committee and student.
- At least a month in advance of the defense, the Chair provides the following to the APO with (1) Name of the student; (2) Title of dissertation; (3) Date, time, and place of the defense; and (4) Names of committee members, their affiliation, and email addresses to which invitations are to be sent.
- Critically review the final, full dissertation in advance of the defense, and come to the defense prepared with comments and questions.
- The Chair presides over the dissertation defense and reports the outcome to the TC, EO and APO.

Outside (Second) Reader(s):

- The Outside Reader (and optional Third Reader) provide specific expertise and quality control.
- The Outside Reader (and optional Third Reader) provide critical review and feedback on First Reader approved drafts of individual dissertation chapters as well as on the First Reader approved full dissertation draft.
- The Outside Reader (and optional Third Reader) will provide a critical review on the final, full dissertation, and come to the dissertation defense with prepared comments and questions.

Guidance on the Three Article Dissertation Model

Overview

This guidance is intended for students who choose to pursue a three article dissertation model. Students, sponsors, and other faculty serving on the dissertation committee should refer to this guidance in deciding whether the three article model would be appropriate for a given dissertation project, and subsequently when the dissertation is being written. This model is an option for DPH students and does not replace the current traditional dissertation model that has been used in the past and which remains as the alternate option. Some dissertation projects fit well under the three article model, and others are better written up in the traditional format. The choice of which model to work under for a given dissertation research project should be based on a discussion between the student and their sponsor, and the amount and complexity of the new research required for a dissertation would be similar no matter which format is chosen.

The DPH dissertation that conforms to the three article model comprises three separate papers (articles) of normal, discipline-specific, journal length that would be considered a 'publishable' research manuscript in a peer reviewed scientific or professional journal. The independence of the three papers reflects the fact that the articles may be read and understood without reference to one another; nevertheless, the papers must support an overarching research theme as outlined in the dissertation proposal. In addition, an overall introduction and conclusion to the dissertation in which the topics addressed in the three articles and, for the conclusion, their findings are synthesized together to provide an overall picture of the implications of the research to the field.

Format

The three papers are preceded in the dissertation document by an abstract and an introductory chapter, and are followed by a concluding chapter. Thus, the form of the 3-paper DPH Dissertation is as follows:

- Title page
- Abstract (for the overall dissertation)
- Table of contents
- List of Tables and Figures
- Acknowledgements and dedications
- Chapter 1: Introduction and background to the general topic area and gaps to be filled by the three articles.
    - Include the dissertation specific aims and hypotheses
- Chapter 2: First paper
- Chapter 3: Second paper
- Chapter 4: Third paper
- Chapter 5: Summary of results, conclusions and implications for policy and/or further research
    - Key Strengths and Limitations
    - Public Health Relevance
- Appendices

Specific Guidelines for the 3-paper DPH Dissertation

1. The introductory chapter provides an overview of the dissertation. It introduces the research theme and conceptual basis; establishes the public health importance of the problem under study; states the primary research questions and hypotheses; introduces methodological approaches; highlights and contextualizes salient literature; and briefly describes policy and programmatic implications. The specific aims and hypotheses of the dissertation must be included in this chapter.

2. The three papers must represent work that was initiated while the student was enrolled in the DPH program and approved by the student's entire dissertation committee at the dissertation proposal defense or officially in writing thereafter. The inclusion of research that was undertaken prior to defense of the dissertation proposal is permissible, however only with explicit committee approval prior to the dissertation proposal defense. As with the conventional dissertation model, all work must be independently conducted by the student.

3. The three papers must conform to the format of a typical scientific journal in the student's field of study, and be of normal length (3000-5000 words, depending on the target journal).For each of the three papers that are part of a student's dissertation, there will be a separate abstract. The three papers in the dissertation will likely include more in the way of methods and results than can fit into or is appropriate for a scientific journal article of normal length. Additional methodological detail, analyses or results synthesis conducted by the student or required by the committee (e.g., additional methodological detail, tables, figures, summaries, sub analyses, sensitivity analyses etc.) that is necessary for the dissertation, but not appropriate or too detailed for a journal article of normal length, should be included in the dissertation as appendices.

4. At least two of the three articles must be based on student analysis of data, either quantitative, qualitative, or mixed methods. A conceptual, theoretical, or methodological article is acceptable as a third paper, but must be closely aligned with the overall theme of the dissertation, and publishable, as judged by the dissertation committee. A literature review or synthesis is not acceptable for the third paper, as relevant literature should be critically appraised within the data analytic papers. However, systematic reviews and meta analyses are permissible.

5. "Publishability" of the articles is determined by the student's dissertation committee, which serves in the capacity of unofficial editorial board for the student. But in general, the committee should judge 'publishability' against the standard of leading peer reviewed scientific journals in the student's field of study.

6. Neither publication nor submission of the three articles is a requirement for completion of the DPH degree. Students may, however, submit committee-approved dissertation 'articles' to refereed scientific journals, even before the final dissertation defense, as external reviewer feedback will enhance quality and learning. In such cases, students should report feedback from peer reviewers to the sponsor and perhaps other committee members, and consult with them on incorporation of suggested modifications to the dissertation. A manuscript's acceptance for publication does not preclude committee members from requiring additional modifications to the manuscript for inclusion in the final dissertation.

7. The concluding chapter establishes the individual and collective contribution of the three articles to the student's area of inquiry. It discusses future research opportunities arising from the dissertation's development of the topic; It also details the public health relevance of findings (e.g., in terms of health policy, programs, practice or interventions). Finally, a critical discussion of key strengths and limitations of the research as it relates to the main findings across the three manuscripts must be included.

8. Authorship
    a. Independence: As with the conventional dissertation model, the DPH dissertation must be substantially the student's own work, and must be judged as such by the dissertation committee/examiners. However, once this has been established, in some cases it may be appropriate to include the dissertation sponsor and other dissertation committee members as co-authors on manuscripts being submitted to professional and scientific journals.
    b. The responsibilities of the first author: The student shall assume the role of first author on dissertation chapters submitted for publication. The responsibilities assumed of first author typically include: synthesis of the relevant literature, development of the major thesis, research question(s) and hypotheses; selection of an appropriate research design; development or adaptation of a conceptual model or framework; study design and data collection (where applicable); data management, analysis, and interpretation of results; preparation of major parts of manuscripts.
    c. Co-authorship: In no cases should authorship be expected or assumed by dissertation committee members. Students may invite dissertation committee members—or external mentors—to co-author a given paper from their dissertation, but the student must assume the role of "first author" on all articles. To be considered a co-author on a manuscript submitted for publication, faculty co-authors must contribute sufficiently to warrant co-authorship. Judgment of the potential contribution of co-authors can also be made by the student in consultation with the dissertation Sponsor, another committee member, or someone external to the dissertation committee. It is suggested that student use recommendations, such as those from the International Committee of Medical Journal Editors, as a guide to make determinations about authorship: (see http://www.icmje.org/recommendations/browse/roles-and-responsibilities/defining-the-role-of-authors-and-contributors.html), which recommends that authorship be based on the following 4 criteria:
        - Substantial contributions to the conception or design of the work; or the acquisition, analysis, or interpretation of data for the work; AND
        - Drafting the work or revising it critically for important intellectual content; AND
        - Final approval of the version to be published; AND
        - Agreement to be accountable for all aspects of the work in ensuring that questions related to the accuracy or integrity of any part of the work are appropriately investigated and resolved.

      Dissertation committee members or external reviewers who may be appointed by the DPH Program at some time in the future to serve as 'examiners' for the purposes of quality control cannot serve as co-authors, but should be thought of more as 'peer reviewers'.

9. This guidance was first issued by the DPH Program in June 2014 and again revised for the 2015 Program Manual. It will be included in the student manual and updated annually and as the program accrues experience with the three article model. Students and committees are expected to adhere to the most recent guidance from the DPH Program, regardless of when the student's dissertation research began.

Guidance on the Traditional Dissertation Model

Overview

This guidance is intended for students who choose to pursue a traditional (book format) dissertation model. Students, sponsors, and other faculty serving on the dissertation committee should refer to this guidance in deciding whether the traditional dissertation model would be appropriate for a given dissertation project, and subsequently when the dissertation is being written. This model is the format that has been used in the past and remains as an alternate option for DPH students who do not choose the three article format. Some dissertation projects fit well under the traditional model and others may be better suited to the three article model. The choice of which model to work under for a given dissertation research project should be based on a discussion between the student and their sponsor, and the amount and complexity of the new research required for a dissertation would be similar no matter which format is chosen.

The DPH dissertation that conforms to the traditional model comprises multiple chapters together in a book format. Unlike the three separate article format, the literature review, methods and conclusions will be presented all together each in its own, single chapter (rather than repeated at the beginning of each of the three articles). The results will also be presented together in one, or if more appropriate, a few chapters. In addition, an overall introduction and conclusion to the dissertation will be included in which the topics addressed in chapters are synthesized together to provide an overall picture of the implications of the research to the field.

Format

The traditional dissertation is organized into sections. Each section may be a single chapter or may include a few chapters, depending on the amount of information being presented and the optimal organization of that information. It is likely that the results section will include more than one chapter as the quantity of analysis required for this dissertation format is similar to that of the three article format. Thus, the form of the Traditional DPH Dissertation is as follows:

- Title page
- Abstract for the overall dissertation
- Table of contents
- List of Tables and Figures
- Acknowledgements and dedications
- Section 1: Introduction and background to the general topic area and gaps to be filled
    - Include the dissertation aims and hypotheses
- Section 2: Literature Review
- Section3: Methodology
- Section 4: Results & Interpretation
- Section 5: Conclusions, Discussion and Evaluation
- Appendices

Specific Guidelines for the DPH Traditional Dissertation

The dissertation must be based on student analysis of data, either quantitative, qualitative, or mixed methods. It may include a conceptual, theoretical, or methodological section as well. A systematic review or meta analyses may be included as part of the dissertation, but is not, in itself, sufficient and additional data analysis is required. Below is a brief description of what to include within each section of a dissertation written in the traditional format.

Section 1. Introduction

This section should introduce the aims of the study, including its justification within the field and its significance, both to the track and to public health overall. As well, this section should present the dissertation aims, guiding research question(s) and hypotheses to be tested. This section might also be used to specify the bounds of this study and its relationship to other ongoing research (if it is an analysis of a large data set that is at the center of multiple studies, for example).

Section 2. Literature Review

This section provides a thorough, critical, and analytical overview of existing literature and scholarship relevant to the aim(s) and research question(s) guiding this study. Ideally, a literature review should be comprehensive, balanced, up-to-date, and organized so as to flow logically.

Section 3. Methodology

The methodology section should clearly and minutely detail the methods of sampling, data collection, and data analysis used. Population and instrumentation should be explained. Where standard instruments are used, they should be appropriately referenced and a discussion of their evaluation in terms of reliability and validity included. This section should also discuss any and all ethical considerations, procedures, and approvals or limitations as well as how reliability and validity are assured for this study in specific. It is imperative that this section be thorough, detailed, and logically organized and clearly presented.

Section 4. Results & Interpretation

Ideally, findings should be presented in subsections. Tables and figures should be included when appropriate for clarity. All interpretation of the results may either be saved for a separate chapter of the dissertation (within this section), or the interpretation may be included the same chapter as the results in a subsection following the presentation of the results. The results might all be presented within a single chapter or, if they are extensive, the results might be organized into a series of shorter chapters by topic.

Results should be summed up in the simplest form first before presenting analysis, in tables if possible, and then interpretation as to significance and conclusions.

Section 5: Conclusions, Discussion, and Evaluation

The fifth and final section should begin by summarizing the study, its aims, any hypothesis, and methods. Then, in referring back to the results presented in section 4, this section should summarize the analytic findings and interpretations, concluding with a discussion of the signification of the findings, whether any hypothesis was proven, partially proven, or disproven. As well, this chapter should look back on the overall study critically, both making the case for its strengths and importance and also discussing any weaknesses or limitations. Finally, the public health relevance should be discussed, including any policy recommendations or practical intervention suggestions. This is a particularly important chapter, as it is the best opportunity to offer a comprehensive view of the study and its lasting significance and to leave the reader with any parting thoughts.

Authorship

a. Independence: As with the three article model, the DPH dissertation must be substantially the student's own work, and must be judged as such by the dissertation committee/examiners. However, once this has been established, in some cases it may be appropriate to include the dissertation sponsor and other dissertation committee members as co-authors on the book generated from the dissertation, individual chapters in the book, or manuscripts developed from the dissertation for submission to professional and scientific journals.
b. The responsibilities of the first author: The student shall assume the role of first author on any book published based on the dissertation as well as on any manuscripts developed from the dissertation and submitted for publication. The responsibilities assumed of first author typically include: synthesis of the relevant literature, development of the major thesis, research question(s) and hypotheses; selection of an appropriate research design; development or adaptation of a conceptual model or framework; study design and data collection (where applicable); data management, analysis, and interpretation of results; preparation of major parts of manuscripts.
c. Co-authorship: In no cases should authorship be expected or assumed by dissertation committee members. Students may invite dissertation committee members—or external mentors—to co-author the book, chapters within the book, or a given manuscript developed from their dissertation, but the student must assume the role of "first author" on all publications (book or manuscript). To be considered a co-author on a book, book chapter or manuscript submitted for publication, faculty co-authors must contribute sufficiently to warrant co-authorship. Judgment of the potential contribution of co-authors can also be made by the student in consultation with the dissertation Sponsor, another committee member, or someone external to the dissertation committee. It is suggested that student use recommendations, such as those from the International Committee of Medical Journal Editors, as a guide to make determinations about authorship: (see http://www.icmje.org/recommendations/browse/roles-and-responsibilities/defining-the-role-of-authors-and-contributors.html), which recommends that authorship be based on the following 4 criteria:
    - Substantial contributions to the conception or design of the work; or the acquisition, analysis, or interpretation of data for the work; AND
    - Drafting the work or revising it critically for important intellectual content; AND
    - Final approval of the version to be published; AND
    - Agreement to be accountable for all aspects of the work in ensuring that questions related to the accuracy or integrity of any part of the work are appropriately investigated and resolved.

    Dissertation committee members or external reviewers who may be appointed by the DPH Program at some time in the future to serve as 'examiners' for the purposes of quality control cannot serve as co-authors, but should be thought of more as 'peer reviewers'.

This guidance was first issued by the DPH Program in August 2015. It will be included in the DPH Program manual and updated annually and as the program accrues experience with the traditional dissertation model. Students and committees are expected to adhere to the most recent guidance from the DPH Program, regardless of when the student's dissertation research began.

Dissertation Defense - Checkpoints

The dissertation defense is open to the public. All committee members must be in attendance at the defense. Only the Outside Reader or the Optional Third Reader may, in extenuating circumstance, participate remotely. If both the Outside Reader and Optional Third Reader cannot attend in person, a different date must be scheduled. Questions, comments, or suggested revisions must be submitted to the committee Chair in writing at least 24 hours prior to the defense by a Reader who is not physically present. If the Outside Reader or Optional Third Reader has electronically attended, faxed/scanned email signatures for this purpose will suffice. All committee members will have read the full dissertation prior to the defense and will be prepared to pose questions and provide feedback/comments at the defense.

Student:

- The student has completed an original research project that addresses a particular public health problem or issue.
- The student has prepared a 10-15 minute formal presentation.

Sponsor:

- The Sponsor has worked closely with the student on the entire dissertation, helped select the committee and approve the dissertation for defense.

First Reader:

- The First Reader has reviewed and provided feedback on the dissertation as it progressed, approved the as the release of the dissertation chapters and the final full dissertation to the committee, and approved the dissertation for defense.

Chair:

- It is the Chair's responsibility to determine when the committee agrees that the dissertation is ready for defense, schedules the defense date, and runs the Defense - assigning the order of questioning, ensuring the productivity of the discussion, managing the voting and paperwork and reporting the outcome to the TC, EO and APO.
- The Chair has provided written feedback to the student on individual dissertation chapters and the full dissertation at least once prior to the defense.

Outside (Second) Reader(s):

- The Outside Reader (and optional Third Reader) has provided specific expertise and quality control.
- The Outside (and optional Third) Reader has provided written feedback to the student on the full dissertation at least once prior to the defense.

Other

- The APO will inform the GC Provost's Office of the defense who will then send a formal invitation to the committee and student.
- The APO will inform DPH Program faculty and students of the scheduled defense in the monthly DPH newsletter and by separate announcement.

Dissertation Defense Process

1. The defense should last approximately 2 hours, but the student and committee members should allow for up to 2.5 hours.

2. All committee members and the student are expected to arrive on time, turn off mobile devices, and remain in the room for the duration of the defense.

3. Immediately prior to the defense, the Committee will convene briefly and the Chair will check if there are any outstanding issues, describe the defense process and assign the order of the questioning. The Sponsor has the option of choosing to be the first or last questioner.

4. Once the Committee, Student, and Audience are assembled, the student will give a very brief (10-15 minute) presentation/overview of the dissertation to get the conversation started. Since all committee members will be intimately familiar with the content of the Dissertation by this point, this presentation should be 10-15 minutes in length, and in no cases should it be more than 20 minutes. This presentation should not detail all aspects of the dissertation, as all committee members will have read the dissertation in advance. It should summarize the gaps in the literature, specific aims, key findings and conclusions for each aim, and public health implications.

5. Each committee member will ask questions for approximately 15-20 minutes.

6. Audience members are allowed brief questions, moderated by the Chair.

7. After the questions end, the students and audience will be asked to leave the room.
   The Chair will facilitate a discussion of the quality of the dissertation and the defense. Then the committee will vote. There are four options,
   a) We certify that the candidate has passed the Final Examination. We accept the dissertation as presented;
   b) We certify that the candidate has passed the Final Examination. We will consider the dissertation acceptable after minor revisions are approved by the Sponsor;
   c) In our judgment the candidate's dissertation requires major revisions. It must be resubmitted for approval by the Sponsor and two members of the examining committee.*
   d) We certify that the candidate has failed the Final Examination, and make the following recommendations.

8. Committee members sign the signature page of the dissertation and the Report of Final Examination. The signature page original goes to the student and the original of the Report of Final Examination to the DPH Office for submission to the Provost' Office. The student cannot deposit without these signed documents.

*In this case, written feedback, prepared by the Sponsor and Chair, must be provided to the student on required revisions. The feedback must be shared with all committee members. The Sponsor and the Chair must review the revised dissertation to ensure that all revisions have been adequately attended to.

Student Professional Development

GC Interdisciplinary Concentrations

The Graduate Center offers a number of Interdisciplinary Concentrations. Some of these concentrations offer core courses, while others guide students in finding courses across different academic disciplines that fulfill the concentration requirements. When students finish the requirements for a concentration they are awarded a physical certificate but the IDS concentrations are not noted on their transcripts. The Interdisciplinary Concentrations include: Advanced Social Research, Cognitive Science, European Union Studies, Fashion Studies, Food Studies, Language and Literacy, Latin American and Caribbean Studies, Lesbian/Gay/Queer Studies, Psychology of Political Behavior, Public Policy and Urban Studies, Twentieth-Century Studies, and Urban Health and Society.

Concentrations will not appear on transcripts but the student will receive a hard copy document stating completion.

Many of these Interdisciplinary Concentrations offer Fellowships and Awards.

http://www.gc.cuny.edu/Academics-Research/Degree-Programs/Doctoral-Programs/Interdisciplinary-Concentrations

GC Interdisciplinary Certificate Programs

Interdisciplinary Certificate Programs are open to students enrolled in one of the existing doctoral programs offered at the Graduate Center. In addition to fulfilling the requirements of their doctoral program, students can choose to complete a Certificate Program.

Programs available to DPH students include: Africana Studies, American Studies, Demography, Film Studies, Interactive Technology and Pedagogy, and Women's Studies. Students who fulfill the requirements of a certificate program have this noted on their transcripts when they graduate.

Required courses for Certificate programs can be used, in some cases, as DPH electives. Meaning, a student in a certificate program may not need to take additional credits as the requirements for the DPH degree and the interdisciplinary certificate may overlap. This option should be discussed with the student's advisor and the director of the certificate program.

Certifications will appear on transcripts and the student will receive a hard copy document.

Many of these Interdisciplinary Certificate Programs offer Fellowships and Awards.

http://www.gc.cuny.edu/Academics-Research/Degree-Programs/Doctoral-Programs/Certificate-Programs

GC Professional Development Seminars

Students may register online for Professional Development Seminars. The courses are 0 credits and do not appear on student transcripts; they are free of charge and open to all matriculated doctoral students at the Graduate Center. Students register for them as they do their academic classes and can find them listed under "Professional Development" in the course schedule. For further information contact the Office of the Associate Provost at 212-817-7282 or RSponzo@gc.cuny.edu

http://www.gc.cuny.edu/Prospective-Current-Students/Student-Life/Professional-Development

GC Advanced Research Collaborative (ARC)

The Advanced Research Collaborative (ARC) extends the Graduate Center's global reach and prominence as an international hub of advanced study. Specifically, ARC promotes interdisciplinary research and partners with the Graduate Center's forty research centers, institutes, interdisciplinary committees, and other academic initiatives. Through its Distinguished Fellowship Program, a research-focused initiative, ARC will offer even more possibilities for collaboration between campus-based and Graduate Center faculty, in addition to visitors, doctoral students, and postdoctoral colleagues.

http://www.gc.cuny.edu/Academics-Research/Advanced-Research-Collaborative

GC Centers & Institutes
The Graduate Center is home to more than thirty interdisciplinary research centers and institutes focused on areas of compelling social, civic, cultural, and scientific concerns. Examples are the New Media Lab, Center for Lesbian and Gay Studies (CLAGS), and the Center for Urban Research.
Many of these Centers & Institutes offer Fellowships and Awards
http://www.gc.cuny.edu/Academics-Research/Advanced-Research-Collaborative/Centers-Institutes

GC Initiatives & Committees
http://www.gc.cuny.edu/Academics-Research/Advanced-Research-Collaborative/Initiatives-Committees

GC Student Business Cards
With permission from the APO, students may order GC business cards. The cards cost $17 for approximately 250. Order through the APO who will then direct you to the Office of Communications and Marketing.

Free Poster Printing at the GC
Free poster printing is available to GC students. Contact Ray Ring, Director of GC Building Design & Exhibitions rring@gc.cuny.edu 212-817-7394 and indicate that you are a student in the DPH program and include a 36" x 48" Power Point slide (which will be your poster) and include the GC logo on that slide. Logo is available by request. http://www.gc.cuny.edu/About-the-GC/Resource-Services/Communications---Marketing/Description-GC-Logo

Academic International Travel - GC Sponsored or Independent, documents required
Mandatory notification requirements and travel insurance for international academic travel by graduate students for independent research, internships, language study, practicums, conference attendance/presentation, or job interviews apply regardless of the source of funding. http://www.gc.cuny.edu/Prospective-Current-Students/Current-Students/International-Travel-Requirements-for-Current-Students

American Public Health Association Membership (APHA)
It is recommended that students join the American Public Health Association (APHA).The American Public Health Association is the oldest and most diverse organization of public health professionals in the world and has been working to improve public health since 1872. The Association aims to protect all Americans, their families and their communities from preventable, serious health threats and strives to assure community-based health promotion and disease prevention activities and preventive health services are universally accessible in the United States. APHA represents a broad array of health professionals and others who care about their own health and the health of their communities. http://www.apha.org/

Public Health Association of New York City Membership (PHANYC)
Public Health Association of New York City (PHANYC) Student Committee is dedicated to getting public health students more informed and involved in the activities of PHANYC, as well as helping to plan PHANYC activities which reflect the interests and needs of students in public health related fields in New York City.
http://www.phanyc.org/about/student.html

Career Services, Employment, Job Listserv/Lists, Awards, and Scholarships and Fellowships

Career Services

CUNY SPH Office of Student Services

The Office of Student Services has established a new initiative Interactive Student Centered Hub of Academia, Research and Entrepreneurship (I-SHARE). I-SHARE aims to facilitate student-centered environment through its various initiatives such as Mentoring program (Peer to Peer and Meet Alumni to enhance Career horizons, MATCH), Career Services, CUNY School of Public Health Student and Alumni Association, Student Innovation Initiative, and Student Resource Center.
sph.cuny.edu/student-services/

GC Office of Career Planning and Professional Development

As part of the 2011 Graduate Center Strategic Plan, the Graduate Center has launched a permanent central career planning and professional development office to prepare students for careers inside and outside the academy. Through one-on-one counseling, workshops, mentoring, job search resources, dossier review, internships, mock interviews and building relationships with employers and alumni, the Office of Career Planning and Development collaborates with faculty to ensure that GC students receive the best co-curricular training available as they prepare to enter the workforce.
http://careerplan.commons.gc.cuny.edu/

The GC Office of Career Planning and Professional Development sends weekly emails, holds online events and webinars, and has an online job search directory.
http://careerplan.commons.gc.cuny.edu/about/

DPH & CUNY SPH Employment

CUNY SPH Adjunct Positions

DPH students are encouraged to apply for adjunct positions at the CUNY SPH consortium schools (Brooklyn, Hunter, Lehman) or other four-year degree granting CUNY schools. Calls are sent via the DPH Jobs Listerv, see below. Students teaching under an adjunct line are eligible to apply for the CUNY Tuition Award. See page 75 for additional eligibility.

DPH & CUNY SPH Research Opportunities for DPH Students

A periodically updated listing of current DPH and CUNY SPH Faculty Research on which students may apply to work as paid and unpaid research assistants or as an independent study is posted on Black Board. Depending on the listing, benefits may be available. Students working on a graduate assistantship line are eligible to apply for the CUNY Tuition Award. See page 75 for additional eligibility.

Please be aware that GC doctoral students cannot act as Teaching Assistants or be asked to grade the work of peers in the same program that they are attending.

DPH Student and Alumni Job Listserv

DPH students and Alumni can subscribe and unsubscribe from the DPH job search listserv. First Register LISTSERV Password and then subscribe and unsubscribe here.

GC and CUNY Job Listings

Graduate Center jobs are listed on the Jobs at the GC page.
http://www.gc.cuny.edu/About-the-GC/Resource-Services/Human-Resources/Jobs-at-the-GC

CUNY-wide positions can be searched for on the CUNY Employment page.
http://www.cuny.edu/employment.html

DPH & CUNY SPH Awards

CUNY SPH Dean's Dissertation Grant

The Dean of the CUNY School of Public Health has committed to fund a limited number of DPH dissertation grants each year. The grant funding period is 12 months. All research funded by the grant must be completed within 12 months of receiving funding, and recipients must submit a final report of the activities completed for the grant and a final budget report detailing spending within 15 months following receipt of the grant.

Students in the Doctor of Public Health (DPH) program who have successfully defended their dissertation proposal are eligible to apply for this funding opportunity to help support the costs associated with dissertation research. In order to be eligible for a Dean's Dissertation Grant, students must be (1) actively enrolled and in good standing in the DPH program at the CUNY Graduate Center, (2) have successfully defended their dissertation proposal, and (3) Have received IRB approval for their dissertation proposal (or have been deemed exempt by the IRB).

Priority for these funds will be given to students who have also applied for external funding.

Proposals for this grant are usually accepted twice a year and the due dates will be announced via email. Additional requirements to apply for the CUNY SPH Dean's Dissertation Grant are part of the application located on Blackboard.

DPH Conference Presentation Travel Award

When funds are available, calls for applications will be sent via email for the DPH Conference Presentation Travel Award. This award is intended to fund DPH students who have been invited to give oral presentations at conferences other than APHA, or poster presentations at any conference (including APHA). Detailed eligibility requirements will be included with the call, which usually goes out towards the end of the spring semester. Students may submit proposals to cover the expenses related to conferences that they already attended or plan to attend during the current academic year.

CUNY SPH APHA Oral Presentation Awards

The CUNY SPH Dean has agreed to fund DPH students who have been invited to give an oral presentation at the annual APHA meeting. Calls for applications will be sent via email for students presenting an oral paper at APHA.

GC Institutional Aid

CUNY Tuition Award- GC Office of Financial Aid

Calls for nomination are sent via email within the first few weeks of each fall and spring semester. This award is not available during the summer. The award covers only New York State tuition charges. If an out-of-state or international student is eligible, they must pay the difference between their tuition charges and the NYS charges at the same level.

Eligibility:

1) Registered full time (7 or more credits);
2) A doctoral level student;
3) Teaching a minimum of 3 credits at a CUNY institution on an adjunct line or be on a graduate assistantship line;
4) Be within your first 10 semesters of attendance in the program;
5) Not have tuition covered by any other tuition award.

http://www.gc.cuny.edu/Prospective-Current-Students/Current-Students/Financial-Assistance/GC-Institutional-Aid

GC Certificate Program GC Centers & Institutes Fellowships/Awards

Please check the Professional Development section of this manual on page 71 for information on all available Certificate and Interdisciplinary Concentrations of which many offer Fellowships and Awards. The below are examples that are currently known to be available to DPH students.

Demography Fellowship (available to students enrolled in the Demography Certificate Program)
Continuing students should apply by submitting the following materials to Demography Certificate Program Coordinator, Shiro Horiuchi shoriuch@hunter.cuny.edu and to CIDR Director, Neil Bennett Neil.Bennett@baruch.cuny.edu: Curriculum Vitae, transcripts, any relevant publications, a 1-2 page description of research interests, and progress toward the dissertation, if applicable.
http://www.cuny.edu/about/centers-and-institutes/cidr/cpd.html

Women's Studies Fellowships & Awards

Please check each award's details as some are available only to students enrolled in the Women's Study Certificate Program, while others are available to all GC students.
Since 1977, the Center for the Study of Women and Society has promoted interdisciplinary feminist scholarship. The focus of the Center's research agenda is the study of gender, sexuality, race, ethnicity, class and nation in relationship to the experiences of women and men in societies around the world.
http://web.gc.cuny.edu/womenstudies/center/fellowships.html#Heilbrun

New Media Lab

THE NEW MEDIA LAB (NML) works with Graduate Center and CUNY faculty and doctoral students from a variety of academic disciplines to conceive and create groundbreaking multimedia projects based on student and faculty scholarly research. Our goal is to integrate digital media into traditional academic practice, challenging scholars to develop fresh questions in their respective fields using the tools of new technology. The NML is committed to a vision of new technology based on open access to ideas, tools, and resources. With ongoing support from CUNY, the New Media Lab has become a dynamic environment in which projects funded by the National Endowment for the Humanities, the Rockefeller Foundation, and other private and public sources demonstrate new approaches and methods of merging digital media, scholarship, and learning.
http://newmedialab.cuny.edu/

CUNY SPH Centers & Institutes
CUNY School of Public Health faculty are affiliated with several City University of New York research centers and institutes. These provide opportunities for faculty and student research.
http://sph.cuny.edu/research/centers-institutes/

GC Office of Research and Sponsored Programs
The Graduate Center Office of Research and Sponsored Programs (RSP) is the central administrative unit for overseeing GC-CUNY applications for, and awards of, governmental and foundation funding. The RSP is ready to answer questions about proposal preparation, submission, and administration for the entire GC Community including faculty and staff, Research Centers and Institutes, and, of course, students!

Funding opportunities, searchable databases as well as information on the Doctoral Student Research Grant Program, can be found at the link below.

Doctoral Student Research Grant Program (DSRG)
The mission of the Doctoral Student Research Grant Program is to foster a research-oriented academic culture among doctoral students and to encourage interdisciplinary discourse at the CUNY Graduate Center by: (a) providing incentives for students to model and meet, early in their careers, the requirements for succeeding in the competition for funds by clearly defining a problem, a project, and a realistic budget; (b) providing an occasion for faculty-student mentoring relationships that are oriented around the concrete problems of proposing, planning for, and executing research; and (c) furthering student professional progress by providing funds for pre-doctoral research publications, presentations, and professional networking. Applications are usually due in December or January.

http://www.gc.cuny.edu/About-the-GC/Resource-Services/Sponsored-Research-Grant-Funding

CUNY-Wide Scholarships &Fellowships

CUNY listings of available scholarships
Be aware that this section of the general CUNY website includes scholarships for all levels of higher education.
http://www.cuny.edu/admissions/financial-aid/scholarships.html

Macaulay Honors College Instructional Technology Fellows (ITFs)
Doctoral students in all disciplines at the CUNY Graduate Center are welcome to apply for the ITFs fellowship. Applicants must be currently registered full-time doctoral students at the CUNY Graduate Center in good academic standing to apply, and if selected as ITFs, must be registered, in good academic standing, and at level II or III at the CUNY Graduate Center during the period of the fellowship. Applicants should be interested in integrating technology and pedagogy for the benefit of students and faculty, both inside and outside of the classroom. They should also be eager to participate with other Instructional Technology Fellows in a multidisciplinary environment whose focus changes semester to semester.
http://macaulay.cuny.edu/eportfolios/itfprogram/

Federal Assistance

Federal Work Study

Federal Work-Study awards are based solely on financial need as defined by federal law. Federal Work-Study awards are packaged each spring for the following academic year. Because Federal Work-Study funds are limited, only students who have their FAFSA on file by the priority deadline (April 30th) are initially considered for awards. Federal Work-Study positions are assigned by the Executive Officer.

Fulbright U.S. Student Program- GC Provost's Office

Established in 1946, the Fulbright Program aims to increase mutual understanding between the peoples of the United States and other countries, through the exchange of persons, knowledge, and skills. Sponsored by the U. S. Department of State, Fulbright, the largest U.S. international exchange program, provides funds for students, scholars, and professionals in all fields of study to undertake international graduate study, advanced research, university teaching, and teaching in elementary and secondary schools.

Fulbright-Hays Doctoral Dissertation Research Abroad Program (DDRA)- GC Office of the Vice President for Student Affairs

The Fulbright-Hays Doctoral Dissertation Research Abroad Program (DDRA) funds individual doctoral students to conduct research in modern foreign languages and area studies for periods of 6 to 12 months. This program is sponsored by the U. S. Department of Education (ED) and is not related to the IIE Fulbright program, which is run by the State Department. The Fulbright-Hays DDRA Program is for students who intend to conduct dissertation research outside of the United States, excluding the countries of Western Europe, and is of particular interest to (but not limited to) students in the social sciences.

http://www.gc.cuny.edu/Prospective-Current-Students/Current-Students/Financial-Assistance/Federal-Assistance

Student Community

CUNY Academy Health Student Chapter

Initiated by DPH students, the CUNY Academy Health student chapter aims to encourage the exchange of knowledge, dissemination of research findings, and networking amongst Graduate Center students in health services research and health policy.
For more information on our AcademyHealth student chapter and how to join Academy Health, please email CUNYacademyhealth@gc.cuny.edu
cunyacademyhealth.ws.gc.cuny.edu
facebook.com/CUNYAcademyHealth
facebook.com/groups/CUNYAcademyHealth
linkedin.com/groups?home=&gid=8260481

The Doctoral Students' Council (DSC)

The Doctoral Students' Council (DSC) is the sole policymaking body representing students in doctoral and master's programs at The Graduate Center of The City University of New York.

The DSC allocates a certain amount of money each academic year to the DPH program. These funds will be used as deemed appropriate by the elected student representative.
www.cunydsc.org/
opencuny.org/dscfac/
facebook.com/cunydsc
See page 4 for more on the DSC.

DPH and CUNY SPH Committees

DPH and SPH committees have student representation. Student representatives in DPH committees represent DPH students. This includes going to meetings (once a semester, sometimes more or less), reporting any concerns students have, and also reporting back to the student body any issues or concerns that representatives feel they should know about. Calls for nominees and voting occurs every Fall semester. DPH Executive Committee (3 positions), DPH Elections Committee (1 position), DPH Admissions and Awards Committee (2 positions), DPH Curriculum and Examinations Committee (2 positions), DPH Faculty Appointments Committee (2 positions). SPH committees SPH Faculty-Student Council (1 position), SPH Curriculum Committee (1 position), SPH Assessment Committee (1 position). Incoming and continuing students are encouraged to participate.
See pages 3-4 for more DPH and CUNY SPH governance and student participation.

The CUNY Academic Commons

The CUNY Academic Commons is part of the City University of New York. We are dedicated to the free expression of our users in a collaborative and sharing environment. We are a community that seeks to use the Academic Commons as a means of fulfilling our highest aspirations for integrating technology into our teaching, learning, and collaborating. Members of the faculty, administration, staff, and graduate students of the City University of New York may register on the Site. We will take all reasonable measures to keep information and users safe.
Check the commons for scholarship, fellowship, and award opportunities.
http://commons.gc.cuny.edu/

OpenCUNY
The OpenCUNY Academic Medium is a student-based, open-source, academic, participatory digital medium for the CUNY Graduate Center community.
To date, OpenCUNY has worked with GC students to develop interactive open-source environments for chartered organizations, student associations, GC-based courses, student-run conferences, graduate research, health initiatives, student activism, personal websites, and an array of DSC initiatives.
http://opencuny.org/

Graduate Center Student Intervention Team (GCSIT)
The Graduate Center Student Intervention Team (GCSIT) supports a healthy and safe on-campus environment by assisting students whose behavior is worrisome or disruptive.
Any member of the college community can reach out to the GC Student Intervention Team to report a concern about a student through our on-line reporting form or by calling a the Student Affairs Office at x 7400. The GCSIT will review the report and take appropriate action. Reports may be made confidentially.

Student Electronic Resources

GC Email Accounts
It is a policy of the GC that students regularly check their GC email accounts. Please note that students redirect at their own risk and it is recommend students periodically check their GC email account as they will need to change passwords at least annually. As of May 2015, students are required to have an @gradcenter.cuny.edu email address. This does not apply to faculty or staff who continue to use @gc.cuny.edu addresses.

Banner ID
All GC students are assigned a Banner ID number. This nine digit number is the unique identifier that students use for all administrative purposes with the GC.

The Graduate Center's Preferred Name Policy
While CUNY recognizes the importance that a change of name might have to students during their time with the University a preferred name is not a legal name, but is generally used to change how others refer to you. For this purpose, students may identify a preferred name to be recorded in the student system. Documents and records that may display a preferred name include, among other things, course rosters, student identification cards, student email addresses, and other documents issued by the University. A preferred name will not be reflected on, among other things, a student's official academic record, diploma, or transcript. To change the name that is displayed/reflected on the official academic record, diploma, or transcript students must follow the instructions on the Name Change Request Form available in the Registrar's Office. Official and legal name changes require specific documentation outlined on that form. The preferred name request form is available on the Registrar's webpage.

Blackboard
Blackboard is an online course management system. In addition to courses that students are registered for, all DPH students have access to CUNY SPH and DPH student Blackboard organizations.

The GC Student Handbook
The Student Handbook for the Graduate Center (GC) of the City University of New York (CUNY) available at http://www.gc.cuny.edu/CUNY_GC/media/CUNY-Graduate-Center/PDF/Publications/Student_Handbook_web.pdf?ext=.pdf. This handbook describes all relevant GC policies and is the official document for students at the Graduate Center. Students are encouraged to review this handbook and are expected to be familiar with all relevant GC policies.

Manhattan Research Library Initiative (MaRLI)
Any New York Public Library cardholder in good standing is eligible to apply to participate in a new library service that offers an unprecedented level of access to our collections. The Manhattan Research Libraries Initiative (MaRLI) offers approved NYPL cardholders the ability to borrow select research library material for at-home use for the first time ever. Additionally, MaRLI participants will be granted access to select materials owned by Columbia University and NYU.
http://www.nypl.org/help/research-services/MaRLI

CUNY Libraries Offer Free Access to the New York Times
Register for the NYTimes Academic Pass for free access through the NYTimes website and smartphone apps. If you already have a personal NYTimes subscription, read this post to find out how to cancel it and resubscribe through the Academic Pass. It also includes updated instructions about what to do if you already have a nytimes.com account (free or paid) tied to your CUNY email address.

Information for DPH Faculty Members

DPH Faculty Members- Roles, Duration, Course Release & Responsibilities

Role	Term	Course Release	Responsibilities
Executive Officer	Three academic years	Four course releases per year (12 credits total)	See Bylaws and above
The Deputy Executive Officer	One academic year	Two course releases per year (6 credits total)	See Bylaws and above
Track Coordinator	Three academic years	Two course releases per year (6 credits total)	See Bylaws and above
Advisor	Until dissertation stage	No course release	See Bylaws and above
Faculty Member	Three academic years, with option for renewal	Releases for defined activities as shown on this chart	See Bylaws, above, and PSC-CUNY contract
Chair of a DPH Committee	Three academic years	No course release	See Bylaws and above
Member of a DPH Committee	Three academic years	No course release	See Bylaws and above
Chair of First Exam Committee	One exam, as assigned	No course release	Chairs Faculty Committee that rates First Exam
First or Second Reader of First Exam(s)	One exam, as assigned	No course release	See above
Sponsor, Chair, and Member on a Second Exam Committee	From proposal to pass of second exam	No course release	See above
PUBH 900 Supervised Dissertation Research: Dissertation Sponsor	From dissertation proposal to defense	One course release for each 5 semesters of sponsorship§ (can be accrued but not banked) (3 credits total)	See above
Chair and Reader on a Dissertation Committee	From dissertation proposal to defense	No course release	See above
PUBH 861 Independent Study: Faculty Sponsor	From registration to completion	One course release for each five semesters of supervision can be accrued§ (3 credits total)	See above

§For example, sponsoring one student for five semesters or five students for one semester each both result in one course release. Once one release has been accrued it must be used.

GC Elimination of the use of Gendered Salutations and References of Students
Effective Spring 2015, the GC's policy is to eliminate the use of gendered salutations and references in correspondence to students, prospective students, and third parties.

Instructor to Student Course Ratio
A course will run with a minimum of five registered Graduate Center students. Courses that are team taught by two instructors require a minimum of 12 GC students. However, the decision that a course requires to be team taught is an academic decision, not one based simply on headcount and requires approval of the EO. A second instructor will not be added to a course after the first day of registration for continuing students unless the Provost has reviewed the program's reason for the requested and grants permission.
Minimum enrollment excludes auditors, non-matriculated students, and CUNY masters and undergraduate permits. The single exception is the PUBH 898 Dissertation Seminar where a minimum headcount enrollment that includes Level 3 auditors (PUBH 900) is acceptable.

CUNY SPH Syllabus Templates
All DPH course syllabi must follow the required SPH format. Templates with DPH core and track competencies are on Blackboard.
Faculty are to submit syllabi upon request from the DPH and/or CUNY SPH offices for records and to maintain accreditation.

Higher Education Opportunity Act Mandate to Notify Students about Required Course Texts
The College is required by the Higher Education Opportunity Act to make the costs of required course materials known to students when they register for classes.
It is necessary to report all required materials for a course that is running. For situations when an instructor does not know the edition of a book, a sample ISBN may be entered. If no texts are required note "no required texts." If at the time of entry you do not know which texts you plan to use, select texts you are likely to use and note "subject to change."

Change of Grade Forms
Faculty request a Change of Grade Form from the APO. Change of grade forms may only be signed and submitted by the instructor to the APO.

Notes on Admissions
The GC Admissions Office puts a hold on accepted applicants who have accepted our offer only when they have not completed a required degree (e.g. MPH). If the accepted applicant is missing Masters Core (Biostatistics; Epidemiology; Environmental Health; Social and Behavioral Dimensions of Health; & Health Policy and Management), the GC does not track this information and it is a responsibility of the student, advisor, and TC to do so.
Accepted students who wish to defer must write an email appealing to defer to the Chair of the Admissions Committee, the Track Coordinator, or the EO. The Chair notes the deferral to the GC Admissions Office either directly or via the APO.
If an incoming student wishes to take a Leave of Absence, they must instead defer.

Faculty Hiring DPH Students
Students may work as research assistants by individual grant holders, but may not act as Teaching Assistant or Graders in the same program that they are attending.

DPH Reappointment
Faculty will be requested to submit a self-assessment report along with a current CV for reappointment to the DPH program. Reappointments occur every three years.

Graduate Center Faculty Policies & Information
Please check the Graduate Center Governance, Policies, & Procedures links for additional information on GC faculty related regulations.
gc.cuny.edu/About-the-GC/Resource-Services/Governance-Policies-Procedures
gc.cuny.edu/Faculty

Room Reservation/Office Space
DPH faculty may make use of the conference room in 3317 at the Graduate Center by reservation only. It should be known that this space is shared by another Graduate Center doctorate program and is not available to the DPH program on Fridays. The conference room in 3317 can be reserved for office hours only by contacting the APO. Larger conference spaces and seminar rooms can be reserved by contacting the APO. The conference room should not be requested for regular class meetings.
Rooms must be requested two weeks in advance and no less than one week in advance.

GC Faculty Building Access After-hours
Faculty may request to the EO to grant after-hours authorization to the Director of Security & Public Safety.

GC Faculty ID Cards
Graduate Center ID Cards can only be obtained in person during regular business hours. Faculty and instructors should contact the APO to request a card. ID Cards require a valid ID Sticker for each semester which can be retrieved from the APO.
Lost ID Cards need to be reported immediately to the Office of Security at (212) 817-7777.

GC Faculty Computer Login and E-Mail Account
A valid Graduate Center Computer Account is required to access computers at the Graduate Center. Once an instructor is appointed to the faculty of The Graduate Center, the APO will contact the faculty member with the required Computer Account User ID and Password. The faculty member will be responsible for creating new his/her password. Problems with GC computers and email should be addressed to the GC Help Desk Helpdesk@gc.cuny.edu (212) 817-7300.
Additionally, it is a GC policy that faculty regularly check their GC email accounts or have it forwarded to their primary CUNY email account.
https://wa.gc.cuny.edu/owa/auth/logon.aspx?url=https://wa.gc.cuny.edu/owa/&reason=0

Faculty Courses in Blackboard
All Blackboard courses are hosted on centralized servers at CUNY CIS. DPH courses are created automatically using data provided by the Graduate Center Registrar's Office. Co-listed courses with the CUNY SPH consortium can be merged (e.g. PUBH 820 Epidemiologic Methods I/EPI 750/ PHE 723). If you are able to log in successfully as a faculty member but do not see your courses listed or need help merging courses, contact the GC Blackboard Administrator directly, Achia Samuels asamuels@gc.cuny.edu 212-817-7314 and/or the Help Desk helpdesk@gc.cuny.edu 212-817-7300.

Faculty Web/Banner
Unlike all other CUNY campuses, the GC uses Faculty Web for attendance and grade recording.
To access Faculty Web, use your 9-digit Banner ID. Upon appointment, you will be notified of your Banner ID. When logging in, be sure to use all the digits including the lead zeros. Your Banner ID and PIN will be the same from semester to semester. Problems with Banner and logging into Banner should be addressed to the GC Office of the Provost at 212-817-7200 provost@gc.cuny.edu.
https://ssb.gc.cuny.edu/prod/plsql/twbkwbis.P_WWWLogin

CUNYfirst and the GC
The GC has not fully transferred over to using CUNYfirst and it is not expected to do so until Fall 2016.

Student Evaluation of Fieldwork	27

1. Introduction

The Council on Education for Public Health (CEPH) is the accrediting body for public health programs and schools in the United States The CUNY Graduate School of Public Health and Health Policy (GSPHHP) is CEPH-accredited as of June 2011, and this includes the MPH and MS degree programs in GPH, HCPA, CBPH, BIOS/EPI, COMHE, EOHS, HPM & NUTR; and the DPH program.

CEPH requires that all MPH students in its accredited programs *demonstrate the application of basic public health concepts through a practice experience* that is relevant to the students' areas of specialization.

In the GSPHHP, fieldwork experience provides MPH and MS students with the opportunity to demonstrate their ability to use the knowledge gained during their graduate coursework.

Each MPH and EOHS-MS student completes a supervised practice experience while signed up for a fieldwork course. The goal is for students to find field organizations appropriate to their specialization and on the basis of their individual interests, professional goals and needs.

The goal of the MPH fieldwork experience is to give students the opportunity to develop, manage, or lead evidence-based public health practices in real-world settings. Students strengthen the core competencies they have learned in the classroom by testing them in organizations that have unique constraints, opportunities and challenges. They develop professionally while helping an organization to advance its own public health agenda in a culturally competent manner. The supervised practice experience strives to improve students professional self-confidence through involvement in developing, planning, organizing, executing and evaluating public health activities. Fieldwork placements may involve program planning, implementation or operation, applied public health research, community health education and outreach, health advocacy or other appropriate public health-related work.

During the fieldwork period, students are required to follow the policies, rules and regulations of the field organization, as well as seek and accept the field preceptor's guidance and appraisal of performance throughout the placement. Students should share with the field preceptor any questions and concerns regarding the progress of the fieldwork and secure approval of the field preceptor for plans how to best use, disseminate or publish information gleaned from the project.

Fieldwork faculty are responsible for developing and implementing policies regarding the approval of preceptors and placement sites and for supervising students in the selection and evaluation of their field placements. They also advise students on the relationship between fieldwork and capstone projects so that the students will be adequately prepared for capstone at the completion of their fieldwork.

This packet presents the policies and procedures for selection, approval, execution, completion and evaluation of the fieldwork experience and provides the forms that must be submitted as part of the fieldwork course.

For additional information, please refer to the fieldwork syllabus.

Prerequisite: Completion of at least **18 credits** toward the master's degree, including at least 3 required core courses (biostatistics, epidemiology, and the course most relevant to your specialization) and at least 2 courses in students' specialization.

2. Fieldwork Site

Options

Depending on opportunities available and scheduling demands, students generally have two kinds of options for their fieldwork, either working with: 1) Government or private organizations: the student works with a fieldwork preceptor at that organization to define a field project that will be appropriate for a capstone project, or 2) CUNY or other academic institutions: the student works with a faculty member on a public health-related research project which may then become a master's essay (provided the student has the required GPA). A wide range of organizations and agencies can provide a valuable field practicum experience for the student. In general, any organization that researches, provides, plans for, coordinates, organizes, pays for, or regulates public health services is a valid training site.

Site selection

Students can identify a fieldwork opportunity in a variety of ways: through their own networks and outreach efforts; with assistance from fieldwork or other faculty, or; via a position they see posted. Fieldwork can be conducted in a wide variety of settings. Most important, the student must be conducting public health work at the site, and with sufficient responsibility to apply some of the skills and knowledge acquired through the MPH program. The fieldwork faculty advisor is responsible for approving the fieldwork site with the approval of the fieldwork contract (see Appendix for a template model).

Examples of types of sites include:

- Federal agencies, such as the USDHHS, Veterans Administration, CDC, USDA, OSHA
- State, county, or city health departments
- Health and social service organizations
- Managed care organizations
- Neighborhood health centers, community clinics, and community mental health centers
- Hospitals (public, nonprofit, for-profit) and multi-specialty medical practices
- Environmental health consulting companies
- Industrial settings
- Early childhood programs, public schools, and private schools
- Academic or other non-governmental research institutes

Expectations of the site

Participating agencies and organizations agree to provide the student with a suitable field experience for a designated period of time and agree to assist in the professional development of that student by identifying an appropriate preceptor at the agency or organization. The agency agrees to provide the student with all materials, equipment, and space needed to conduct the work in a professional work environment. The agency submits a written and signed letter of a confirmation that identifies the student, the agreed upon scope of the fieldwork project, and expected deliverables from the student.

Criteria for site selection

- The site is able to provide appropriate public health experience as it relates to the student's career goals and area of concentration.
- The site is able to provide support and space for the student appropriate for the student's experience.
- The environment of the site is safe for the student's field practicum experience. The site has an available preceptor who is qualified and able to spend time with the student and provide guidance.
- The preceptor has an understanding of the educational needs of public health students, including the need to increase responsibility and independence gradually.
- If fieldwork is to be performed in a student's own current job setting, the student must generally identify a different supervisor and engage in a substantially different assignment which is outside the scope of his or her usual activities.

3. Major Players

Close cooperation is essential between the following players:

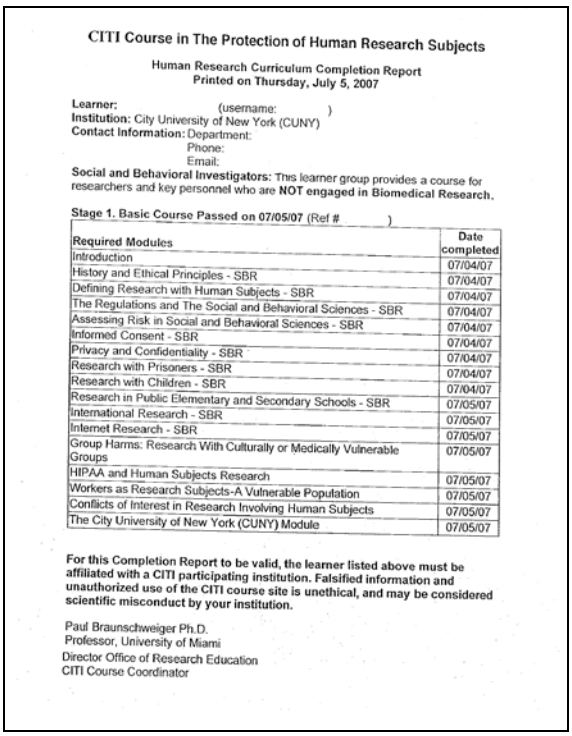
- Student (the masters degree student)
- Fieldwork faculty member -- the faculty member from the student's program assigned to the fieldwork course for the semester during which the student is registered for the course (also referred to as the 'fieldwork faculty').
- Fieldwork Preceptor (also known as 'fieldwork supervisor,' or 'preceptor')

Student

Students are primarily responsible for developing a scope of work for the fieldwork, in consultation with their preceptor and the faculty fieldwork member, and for carrying out that scope of work. Students are also responsible for submitting appropriate paperwork at the beginning, during, and at the end of the enrolled Fieldwork semester.

Students are expected to attend scheduled classes held during the Fieldwork semester and submit periodic assignments. Three didactic sessions are included in the course to augment student competencies on project planning, management and leadership, and ethical research, and to prepare the student for the Capstone project.

During the course of the fieldwork project, students are expected to meet regularly with the preceptor to discuss progress and raise any questions or problems regarding the work. Students are expected to treat the fieldwork as they would any job and follow organizational policies and meet all commitments to the agency. In addition, if the student feels that the field experience will not enable him or her to produce the agreed upon deliverables (whether from lack of access, lack of supervision, changing organizational priorities, etc.) it is up to the student to alert the field supervisor.



Responsibilities of the student for the fieldwork experience include:

- Identifying and organizing the fieldwork project
- Submitting appropriate paperwork
- Following the policies, rules, and regulations of the field agency or organization.
- Maintaining the agreed upon working hours.
- Maintaining a professional attitude and conduct.
- Seeking and accepting the field preceptor's guidance and appraisal of performance throughout the work period.
- Sharing with the field preceptor any questions and concerns regarding the progress of the field work.
- Planning for conferences with the fieldwork preceptor.
- Attending requested meetings and workshops.
- For some programs, maintaining a weekly fieldwork log and submitting all logs to the fieldwork faculty member at the end of the course.
- Submitting to the host agency all agreed upon deliverables within the time frames indicated by the preceptor.
- Providing the host agency with a copy of the student's final capstone project.
- For further information, please contact the fieldwork faculty member in your area of concentration.

Fieldwork Faculty Member

Within each degree program, the designated fieldwork faculty member approves fieldwork contracts, tracks required fieldwork paperwork, provides guidance and support to the student and site supervisor during the semester, and determines the student's grade for the course (pass or fail), based on a review of the fieldwork supervisor's evaluation and additional fieldwork requirements. **The fieldwork faculty member provides guidance to the student to maximize the learning potential of the field experience.**

- All fieldwork faculty members must maintain a valid human subjects training certificate, even if they are not currently conducting research with human subjects.
- The fieldwork faculty member guides and tracks the development of fieldwork contracts, submission of IRB determination forms, and evaluation forms.
- The fieldwork faculty member assists students and preceptors in resolving problems that arise during fieldwork placement.
- The fieldwork faculty member assists students in the initial conceptualization of the Capstone project from the field experience.
- The fieldwork faculty member instructs students on topics aimed at improving the field experience and preparing the student for the capstone course.

CITI Course in The Protection of Human Research Subjects

Human Research Curriculum Completion Report
Printed on Thursday, July 5, 2007

Learner: (username:)
Institution: City University of New York (CUNY)
Contact Information: Department:
Phone:
Email:

Social and Behavioral Investigators: This learner group provides a course for researchers and key personnel who are **NOT engaged in Biomedical Research.**

Stage 1. Basic Course Passed on 07/05/07 (Ref #)

Required Modules	Date completed
Introduction	07/04/07
History and Ethical Principles - SBR	07/04/07
Defining Research with Human Subjects - SBR	07/04/07
The Regulations and The Social and Behavioral Sciences - SBR	07/04/07
Assessing Risk in Social and Behavioral Sciences - SBR	07/04/07
Informed Consent - SBR	07/04/07
Privacy and Confidentiality - SBR	07/04/07
Research with Prisoners - SBR	07/04/07
Research with Children - SBR	07/04/07
Research in Public Elementary and Secondary Schools - SBR	07/05/07
International Research - SBR	07/05/07
Internet Research - SBR	07/05/07
Group Harms: Research With Culturally or Medically Vulnerable Groups	07/05/07
HIPAA and Human Subjects Research	07/05/07
Workers as Research Subjects-A Vulnerable Population	07/05/07
Conflicts of Interest in Research Involving Human Subjects	07/05/07
The City University of New York (CUNY) Module	07/05/07

For this Completion Report to be valid, the learner listed above must be affiliated with a CITI participating institution. Falsified information and unauthorized use of the CITI course site is unethical, and may be considered scientific misconduct by your institution.

Paul Braunschweiger Ph.D.
Professor, University of Miami
Director Office of Research Education
CITI Course Coordinator

Preceptor

The preceptor is the key to a successful fieldwork experience. The preceptor serves as both supervisor and mentor. Preceptors are expected to provide students with an orientation to the organization and project, meet with students regularly, and provide guidance and feedback. The preceptor is expected to have expertise in the area of the student's project so proper guidance can be provided, and an MPH or other graduate degree, or significant and demonstrable experience in a public health management role. Preceptors help students develop a written fieldwork contract specifying the expectations for the fieldwork. Preceptors also complete an evaluation of the student's performance at the end of the work experience, as the preceptor has the primary responsibility for supervising and guiding the student in the development and implementation of the fieldwork project. The role of the preceptor includes the following activities:

- Assist the fieldwork student in determining specific, mutually- agreeable, written fieldwork objectives & deliverables to the agency.
- Orient the student to the field organization's mission, programs, policies, protocols.
- Commit time for instructional interaction & dialogue w/ student.
- Provide supervision of the student's activities.
- If indicated, resolve conflicts w/ agency or organization policy.
- Prepare an evaluation of the student, and discuss it with the student prior to sending it to the fieldwork faculty member.
- Transmit the student's final evaluation to the student's fieldwork faculty member.
- Share any comments and/or suggestions about the field experience with the course fieldwork faculty.
- Allow student to use some or all of the work product to prepare capstone paper.

4. The Relationship Between Fieldwork and Capstone

- Fieldwork is a prerequisite for Capstone. In other words, students may start the Capstone course only when they have completed their fieldwork and understand how it will inform the Capstone project.

- The fieldwork experience provides the basis and the foundation for the Capstone project. During fieldwork, the student is involved in public health practice, and shapes a research question and study design for executing through the Capstone project. Generally, the data or information

- The Capstone paper reflects the research question and investigation informed by the student's fieldwork experience.

    - The Master's Essay is an exception to this model. Here, students work with individual faculty members or academic institutions on specific research projects. These must be approved by the faculty member who will be working with the student and by the fieldwork faculty. To be eligible for the Master's Essay option, students must have a minimum GPA of 3.8.

    - In some circumstances, when the fieldwork project does not generate data as expected, the Capstone project may be based on an activity or data analysis other than the fieldwork experience. If this decision is reached during the fieldwork course, the new plan must be approved by the fieldwork faculty advisor. If it is reached at the beginning of the Capstone course, the decision and plan must be approved by the Capstone faculty advisor.

- During the fieldwork semester, students prepare and submit several deliverables based on their work in the placement, and in preparation for the Capstone project. These are discussed below.

5. Fieldwork Timeline

When?	Activity
Preparation for supervised fieldwork	• Notify your program advisor of intention to register for fieldwork, and discuss your eligibility for the course. • If you are searching for fieldwork opportunities or assessing potential fieldwork sites, contact the GSPHHP fieldwork coordinator and your academic advisor to help identify target sites and to confirm program fit. • **Fieldwork Information Sessions are held twice each semester, and offer information and guidance for identifying and securing a placement. Student attendance to one of these sessions is highly recommended.** • Identify a fieldwork opportunity. Working with the fieldwork faculty advisor and/or the GSPHHP fieldwork coordinator, secure the placement with the preceptor via an approved Fieldwork contract (template is included in the Appendix). • Once you have submitted a finalized, approved Fieldwork contract, you are eligible to register for the course in the upcoming semester.
Carrying out and participating in supervised fieldwork	Begin the fieldwork placement. • IRB approval is required before the student can begin any data collection activities. The student works with the faculty advisor to develop and finalize submission to the IRB. All students must present a current CITI certificate, even if the project does not require IRB review (eg, systematic literature reviews, secondary analysis of publicly available data) • Submit assignments, attend class meetings, and meet with your fieldwork faculty advisor, as instructed. It is recommended that you keep a work/time-log of fieldwork activities so you can recall how your time was spent, confirm the number of hours in the placement (expected 180 hours total), and articulate the processes involved. • Students will complete two progress reports to track their progress, assess potential challenges, and identify solutions. • Faculty may choose to require students make additional submissions, such as a Rapid Lit Scan, a project Logic Model, and a project Gantt Chart.
Successful completion of the fieldwork experience	Fieldwork students must submit and receive a passing grade for **several deliverables** to successfully complete the supervised fieldwork requirement: (1) Submit two evaluation forms: the **Student's Evaluation of Fieldwork Experience Form, and the Preceptor's Evaluation** of your performance (instructions for both are included in the Appendix). (2) Submit a **Literature review:** conduct a brief literature review (2-4 pages) during fieldwork to frame and guide the Capstone proposal (example included in the Appendix). (3) Complete and submit your **Reflections on Fieldwork** (instructions are included in the Appendix). (4) As preparation for the Capstone class, develop and submit **a Capstone Proposal** (outline included in the Appendix).

6. CUNY Policy for Student Research with Human Subjects and IRB

All students are required to complete and submit an **Institutional Review Board (IRB) Research Determination Form** to the fieldwork faculty advisor early in the Fieldwork course. This brief form describes the project, as well as any human subject involvement, and institutions/individuals involved. The faculty advisor will work with the campus IRB office to review this document and assess whether a full IRB proposal must be submitted, or if the project is exempt from human subject research issues. For the purposes of this submission, the student is the Project Investigator and the fieldwork faculty is the faculty advisor. Campus IRB approval or exemption is required before the student can begin data collection.

Research in CUNY

Research conducted in the City University of New York (CUNY) is subject to federal regulations, which require that all research protocols involving human subjects be reviewed by an IRB office. However, these regulations allow many types of course-related studies to be exempted from IRB review, depending on potential risks to participants.

Definitions

Research: Research involves "a *systematic* investigation, including research development, testing and evaluation, designed to develop or contribute to *generalizable* knowledge." (Citiprogram.org)

Human subject: "A human subject is a living individual about whom an investigator conducting research obtains 1) data through *intervention* or *interaction with the individual*, or 2) *identifiable* private information." (Citiprogram.org)

Risk: The probability of harm or injury (physical, psychological, social or economic) occurring as a result of participation in a research study.

Source: *Health Sciences Doctoral Programs Faculty Handbook* (Aug 2009).

7. Fieldwork Waiver

A *practical experience* is required of our students in order to assure the competency of our graduates when they enter the field of public health. The professional degree student who graduates from CUNY GSPHHP, as well as all other accredited schools of public health, must have "skills in basic public health concepts and demonstrate the application of these concepts through a practice experience that is relevant to the students' areas of specialization."

In very rare instances, fieldwork is waved for MPH students who are admitted to the CUNY Graduate School of Public Health and Health Policy already possessing extensive public health experience. Before a waiver is granted, the student must demonstrate "experience in application of basic public health concepts and of specialty knowledge to the solution of community health problems." Public health knowledge includes the core competencies as well as a population approach to health problems, use of a prevention framework, and collaboration with community partners. The student must also show that their previous experiences relate to specialty knowledge acquired in their specialization track.

Eligible students should discuss the possibility of a waiver with their academic advisor within one year of enrollment. The associate dean for academic affairs will determine if the written summary of the student's experiences demonstrates an adequate applied public health experience in the appropriate area of concentration.

The summary should include:

- Name of the organization(s)
- Name, title and contact information of supervisor(s)
- Dates and approximate number of hours of experience
- Description of how the experience demonstrates application of the core and specialty public health knowledge. (Refer to the core MPH competencies and the competencies for your specialization.)

When all parties have signed off, the original form and attachment should be forwarded by the student to the school office for inclusion in the student's academic file. Copies should also be sent to the track advisor, fieldwork faculty member representing the student's program, and the GSPHHP evaluation coordinator.

If a waiver is granted, the student is expected to select another course to fulfill the credit requirements of the program.

The format for requesting a fieldwork waiver is as follows:

The student requesting a fieldwork waiver must submit the information requested below, with the accompanying statements, and attach to it a summary of her/his public health experience. This summary should tell us the type of educational or professional experiences you are submitting in consideration of a waiver of your practice requirement. The summary should include the name of the organization(s); name, title and contact information of supervisor(s); dates and approximate number of hours of field-based experience; and a description of how the experience demonstrates application of knowledge from the core and specialty public health areas. This waiver form must be submitted to the GSPHHP Associate Dean of Academic Affairs within twelve (12) months of enrollment.

I request a waiver of the fieldwork course. I have extensive public health experience and have acquired skills and content in the core and specialty public health areas. A summary of these experiences is attached.

APPENDIX

FIELDWORK CONTRACT TEMPLATE

[TO BE PLACED ON HOST ORGANIZATION LETTERHEAD]

Project title

[Reflects the general focus of the work, ie, topic and setting, or more specific proposed research question, ie, investigation of specific public health problem in type of setting with population group]

[Date]

Dear Fieldwork Faculty Advisor:

This represents an agreement between [**student name**], MPH student at the CUNY Graduate School of Public Health and Health Policy, and [**preceptor name, position title, host organization**] describing the tasks and goals of both parties as they relate to the supervised fieldwork to be performed beginning [**start-date for placement**] and projected to end [**end-date for placement**] on the [**name of project, if applicable**]. The fieldwork student and preceptor agree that the fieldwork student is responsible for 180 hours of service in this role.

Project background

[Provide one or two paragraphs describing the background and context for the project, including, if applicable, topic of focus, methodology, host organization.]

Project plan

[Describe the specific project(s) in which student will be involved for placement.]

Student tasks and responsibilities

[List the specific activities which the student will carry out in the fieldwork placement, and its relevance to public health.]

Preceptor responsibilities

[Provide two to three sentences affirming the preceptor's responsibility for providing guidance supervision, and evaluation for the student in the placement, confirming the student will be allowed to use the project data for her/his Capstone paper, and describing the preceptor's own public health experience, including any graduate education.]

Agreed to by:

[Student signature	**[Preceptor signature**
Student name	**Preceptor name**
Date]	**Date]**

LITERATURE REVIEW EXAMPLE

Implementing a program to increase school meal participation and improve the school food environment in a low-income New York City elementary school

[Student Name]

In a recently released Food Research and Action Center (FRAC) report, the South Bronx (New York 16th Congressional District) ranked first and central Brooklyn ranked sixth (New York 10th Congressional District) in food hardship.[1] This report's unsettling results urge us to further explore hunger and food security, defined as "including both physical and economic access to food that meets people's dietary needs as well as their food preferences,"[2] in New York City (NYC) where 37% of residents experienced difficulty affording food in 2010.[3]

In the United States, an estimated 14.7% of households were food insecure in 2009.[4] However, among households below the official poverty line ($21,756 for a family of four), 43.0% were food insecure and 24.9% and 26.9% of Hispanic and Black households respectively were food insecure compared with 11% in whites.[4] Twenty-one percent of households with children under 18 years old were food insecure with single parent households having even higher rates: 35.6% in single mothers and 27.8% in single fathers.[4] The higher than average prevalence of food insecurity in families with children raises concerns of the health of children. While caloric energy needs are generally met by food insecure children, dietary quality may be compromised.[5] Children from food insecure households have greater odds of being in poor health, having a chronic condition, and having asthma than children from food secure households.[6]

The association between food insecurity and obesity is well-established, with the risk of obesity being greatest in non-whites.[7-10] The growing epidemic of childhood obesity disproportionately affects children of low-socioeconomic status (SES) and certain ethnic minority groups, the same groups that are at high risk for food insecurity. Data from the 2007 National Survey of Children's Health (NSCH) show Hispanics and non-Hispanic Blacks have more than two times the odds of obesity than non-Hispanic whites.[11]

Consideration of food insecurity and its associated health risks adds to the challenge of our nation's call to aggressively address childhood obesity. School meal programs are one avenue to strategically address both food security and improve the diets of food insecure children at high risk for developing obesity and diet-related diseases. The federally assisted National School Lunch Program (NSLP) and the School Breakfast Program (SBP) are provided through the United States Department of Agriculture Food and Nutrition Service (USDA FNS). The NSLP serves free and low cost lunches to more than 31 million children each school day[12] while the SBP provides free and low cost breakfast to 11.1 million students per day.[13] School meal participation and access have shown to strengthen food security; a recent study showed that households with access to the SBP had lower marginal food insecurity than households without access to SBP.[14]

School meals provided by the NSLP and SBP follow nutritional requirements based on the Dietary Guidelines for Americans (DGAs), and for many NSLP and SBP participants, school meals may be the most nutritious food consumed in their diets. The literature indicates that dietary intake in NSLP participants is superior to non-participants in certain areas including lower consumption of energy-dense, low-nutrient foods; lower consumption of sugar-sweetened beverages; lower caloric intake; higher fiber intake; and higher calcium intake.[15,16] School Breakfast Program participants have been shown to have higher intakes calcium, magnesium, phosphorus, fruits and vegetables, and lower intakes of red meat and cholesterol than non-participants.[17] Another study found that in an ethnically-diverse, low socioeconomic status (SES) population with low fruit and vegetable consumption, NSLP provided the primary source of FV for schoolchildren,[18]suggesting that school meals are an important source of nutrient dense food in low-SES, minority populations. In addition to the nutrition provided by school meal programs, NSLP and

SBP participation also provide a protective effect against obesity in girls.[19] Another study found that SBP participants had lower body mass indices (BMI) compared with non-participants.[20]

Despite positive outcomes seen with school meal programs, NSLP and SBP, NYC has low participation rates in both programs which are administered by the NYC Department of Education Office of SchoolFood (SchoolFood). Of 1.1 million children in NYC public schools, 70% are eligible for free and reduced-price meals.[21] However, only 38% of NYC high school students, 70% of middle school students, and 84% of elementary school students participate in the school lunch program.[21] Breakfast has a citywide participation rate of 22% despite being free to all NYC students.[21] In the South Bronx where the poverty rate is 41%[22] and where food insecurity is very high,[1] ensuring that children are participating in SchoolFood programs can have a profound effect on both food insecurity and adverse diet-related health problems.

Schools represent an ideal location for interventions that can improve both school meal programs and school environments. Children spend more time in school than any other institution and consume up to 50% of their daily calories during school hours,[23] making the school food environment a unique location where healthy eating behaviors can be taught, encouraged, and reinforced. The Institute of Medicine identifies the school food environment, which encompasses all foods eaten in and around a school, as a key area for targeting the childhood obesity in the United States.[24]

Acknowledging the school environment as a focus area for addressing childhood obesity, congress passed the Child Nutrition and WIC Reauthorization Act of 2004 which mandated that all schools participating in the NSLP enact local wellness policies that set standards on school meals and support a healthful school food environment.[25] Researchers and organizations also call for strong school wellness policies, but there is a lack of evidence-based strategies for their implementation.[23,26,27] Major challenges and barriers include the lack of funds, dedicated personnel, and time needed to implement and maintain wellness policies and work towards a healthier school environment.[28-30] Strategies to address these challenges are also sparse in the literature, especially at the local and building-level. Tool kits and practical guides are available through hunger, nutrition, and wellness organizations; however, the guides are not evidence-based and are largely anecdotal.[31-33]

We hypothesized that there is a gap between policy mandates and building-level implementation that is especially apparent without a key staff member dedicated to school wellness. Additionally, low school meal program participation rates in NYC indicate that there are barriers to participation that should be addressed. The City Harvest Healthy Schools program aims to fill this gap by placing dedicated Fieldwork students in low-resource NYC schools to provide manpower, strategies, and resources to improve school meal participation and the food environment within the school community which in turn can increase food security and access to healthy food in NYC's high-need communities.

INSTRUCTIONS FOR 'REFLECTIONS ON FIELDWORK'

Students are required to think about their fieldwork experience and provide a written reflection when they have completed the placement.

Your reflections statement should be 2-4 pages in length, and address the following:

- The extent to which your graduate course work prepared you for the fieldwork experience.
- The quality of on-site supervision you received from the preceptor and others at the site during your fieldwork. Was someone generally available to answer your questions and provide feedback? Discuss the usefulness and value of the feedback you received.
- Challenges or problems you encountered during the fieldwork and how they were addressed. What technical or human obstacles did you encounter? Were there any deviations from your original plan or expectations for the fieldwork (for better or worse!).
- The overall quality of the fieldwork. Were there particular skills, knowledge or lessons that you acquired unexpectedly? Explain. Was the fieldwork a good educational experience – why or why not? How did it provide you with a better sense of the skills needed for employment in the profession? Discuss recommendations for improving your fieldwork experience. Explain why you would or would not recommend that other students conduct fieldwork with the same department or agency.

CAPSTONE PROPOSAL OUTLINE

Capstone Paper Proposal - OUTLINE AND GUIDANCE

Proposed paper title:

Background:

Proposed paper topic:

In one or two sentences, describe the overall topic, or research question, to be addressed by this paper.

Briefly review the literature on the topic in a structured argument that justifies the analyses you are proposing to conduct or the paper you plan to write. What will your paper add to the literature currently available on this topic? This section should be no more than 2 pages (500 words) long and must include citations. The basis for this section may be your fieldwork literature review, enhanced by any other references.

Specific Aims or Hypotheses:

What are the questions that this paper will attempt to answer? The background section should lead the reader to see the importance of the questions you say you will answer n these aims. You should have a single hypothesis or no more than 4 aims.

Methods:

Briefly, describe the source of the information, experience, theoretical framework or data that you will be using in this paper. In the methods section you should include a casual diagram or logic model that can help guide your faculty advisor through your study design.

Data analysis Plan:

Describe your plans for data analysis in detail. Begin by defining how you will collect your information or if secondary sources are being used, describe them in detail. For qualitative data, describe coding methods, themes to be examined, etc. For quantitative data, describe the variables you will be using, how they will be recoded or categorized, how you will present the data (e.g. present odds ratios or rate ratios or betas) in your paper and the statistical tests you plan to use. For a systematic review or policy paper, describe the data bases to be consulted and the initial search terms, how you plan to organize the literature into subtopics or themes. Clearly describe inclusion and exclusion criteria for database searches. If you plan to use software for your analysis (e.g. NVIVO, Excel, SPSS, SAS), specify which programs you will use.

Citations:

The citations for the introduction section should be included here.

You must use reference management software (Refworks, Endnote, etc.) to put citations in your proposal and format the bibliography using the AJPH style.

PRECEPTOR EVALUATION INSTRUCTIONS

(Note: Each Specialization within CUNY GSPHHP has a Unique Form)

PUBLIC HEALTH NUTRITION

Fieldwork Preceptor Evaluation Form

Student: _____ Preceptor: _____

Name of Agency: _____ Dates of placement: _____to _____

	Please check one box in each row.				
	Excellent (performs on a level that is highly professional)	**Above average**	**Average** (needs to improve)	**Below average**	No opportunity to observe
PROFESSIONAL QUALITIES					
1. Appreciation and knowledge of:					
a) Technical & political climate within which agency works					
b) Health education principles and concepts					
2. Skills in:					
a) Planning					
b) Implementation					
c) Organizing					
d) Program analysis and evaluation					
e) Writing					
f) Verbal communication					
g) Nutrition counseling/education					
OVERALL PERFORMANCE					
1. Establishes friendly relationship with co-workers.					
2. Organizes and uses time effectively.					
3. Considers and incorporates the ideas of others					
4. Is able to facilitate work of committees and other groups.					
5. Submits accurate, well documented work and reports.					
6. Accepts responsibility and completes work assignments					
7. Raises innovative ideas and brings out creative and innovative ideas in others					

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. Special strengths:
2. Skills and knowledge needing further improvement:
3. Other comments:

Preceptor Signature_____ **Date**: _____

You are encouraged to discuss this evaluation with the student. Kindly return the completed form to:

EPIDEMIOLOGY/BIOSTATISTICS

Fieldwork Preceptor Evaluation Form

Student: _____ Site Supervisor: _____

Name of Agency: _____ Dates of placement: _____

	Please check one box in each row.				
	Excellent (performs on a level that is highly professional)	**Above average**	**Average** (needs to improve)	**Below average**	No oppotunity to observe
PROFESSIONAL QUALITIES					
1. Appreciation and knowledge of:					
a) Technical & political climate within which agency works					
b) Public health principles and concepts					
2. Skills in:					
a) Planning					
b) Implementation					
c) Organizing					
d) Program analysis and evaluation					
e) Writing					
f) Verbal communication					
g) Data manipulation/analysis					
OVERALL PERFORMANCE					
1. Establishes friendly relationship with co-workers.					
2. Organizes and uses time effectively.					
3. Considers and incorporates the ideas of others					
4. Is able to facilitate work of committees and other groups.					
5. Submits accurate, well documented work and reports.					
6. Accepts responsibility and completes work assignments					
7. Raises innovative ideas and brings out creative and innovative ideas in others					

COMMENTS (Please respond briefly. Use reverse side if necessary):

1. Special strengths:
2. Skills and knowledge needing further improvement:
3. Other comments:

Site Supervisor's Signature_____ **Date**: _____

C. BRIEF COMMENTS

1. Special strengths:
2. Skills and knowledge needing further improvement:
3. Other comments:

Site Supervisor's Signature_____ Date: _____

You are encouraged to discuss this evaluation with the student. Kindly return the completed form to:

HEALTH CARE POLICY & ADMINISTRATION
Fieldwork Preceptor Evaluation Form

Supervisor's Name _____ Title_____

Agency _____

Phone _____ E-Mail _____

Address _____

Name of Fieldwork Student _____

Date of Evaluation_____

PART A - Please evaluate the student by checking the appropriate box..

FACTORS:	**Excellent**	**Very Good**	**Good**	**Fair**	**Poor**	**No opportunity to observe/does not apply**
Work performance						
1. Arrives on time consistently						
2. Uses time effectively						
4. Reliably completes tasks on time						
5. Effectiveness in written communication						
6. Effectiveness in oral communication						
7. Ability to identify problems and troubleshoot						
8. Overall quality of work produced						

Work attitudes						
FACTORS:	**Excellent**	**Very Good**	**Good**	**Fair**	**Poor**	**No opportunity to observe/does not apply**
1. Accepts responsibility						
2. Takes initiative						
3. Follows policies, rules, regulations of agency						
4. Accepts ideas and suggestions of others						
5. Performs tasks with industry and drive						

Professional relationships with:						
FACTORS:	**Excellent**	**Very Good**	**Good**	**Fair**	**Poor**	**No opportunity to observe/does**

						not apply
1. Professional staff						
2. Support staff						
3. Supervisor						
4. Personnel from other organizations						
5. Patients/ clients/participants						
6. General public						

Application of community health skills	**Excellent**	**Very Good**	**Good**	**Fair**	**Poor**	**No opportunity to observe/does not apply**
FACTORS:						
1 Assessing health problems						
2. Developing health objectives						
3. Planning health programs and projects						
4. Managing planned programs						
5. Evaluating program outcomes						
6. Developing budgets						
7. Applying research methodologies						
8. Compiling health data/statistics						
9. Facilitating group process						

Personal characteristics						
FACTORS:	**Excellent**	**Very Good**	**Good**	**Fair**	**Poor**	**No opportunity to observe/does not apply**
1. Dependability						
2. Tactfulness						
3. Listening ability						
4. Sensitivity						

PART B – Please rate the fieldwork student on his or her personal fieldwork objectives

Met Not Met

1.

2.

3.

4.

5.

PART C - Please answer as completely as possible. Use a separate sheet if necessary.

1. What are the outstanding strengths of the fieldwork student?
2. What are the areas needing improvement?
3. Other comments regarding the student.
4. **What is your overall assessment of this student?** (Circle appropriate letter)

A =Excellent; A-- =Very good; B+ or B = Good; B- = Fair; Below B- = Poor.

STUDENT EVALUATION OF FIELDWORK

Please provide an honest assessment of your internship experience

1. Student's name: _____

2. Title of project:_____

3. Date of this form: _____

4. Fieldwork start & completion dates:_____

5. Preceptor's name & title:_____

6. Agency name and address:_____

_____

7. Total number of hours completed:_____

8. Describe the primary duties for which you were responsible:_____

_____

_____

9. Overall, how would you rate your fieldwork experience?
Excellent Very good Good Fair Poor

10. Rate the level of guidance/mentoring you received from your preceptor:
Excellent Very good Good Fair Poor

11. Would you consider working for this agency after you graduate?
Yes No Not sure

12. Would you recommend this placement for other students? Why or why not?

_____

_____

13. Please provide a brief summary of the most important things you learned from your fieldwork experience:

_____

_____

14. How prepared do you think you are in the following areas as a result of your fieldwork? *Insert an X in the appropriate box for each competency.*

	Very well prepared	Well prepared	Adequately Prepared	Inadequately prepared	Not prepared	Not applicable to my project
Core public health competency						
Apply the core functions of public health practice (assessment, policy development, and assurance)						
Understand basic theories, concepts, models and methods from a range of core and related disciplines and apply them to the design of PH research, policy, and practice.						
Apply ethical and social justice principles and standards						
Interpret and apply the public health literature.						
Use basic statistical and informatics techniques						
Communicate public health information verbally and in writing						
Explain key social, behavioral, biomedical and environmental determinants of and inequities in health and disease across the lifespan in urban settings						
Design and evaluate interventions to prevent or control urban public health problems						
Collect, analyze and interpret public health data						
Collaboratively engage with diverse groups						
Describe the legal foundations of the US public health system and its interrelationships with other systems (e.g. health care, education, environmental protection)						
Use key planning constructs (e.g. values, vision, mission, goals, objectives and outcomes)						
Demonstrate knowledge of the context of public and private health care systems, institutions, actors, and environments in which health care and public health policy is made and health care is delivered.						

15. In the space below, please provide any additional comments or suggestions that would help improve the fieldwork experience. Use as much space as you need.

Table 2.4.b.1: Agencies and Preceptors Used for Practice Experiences by Students, 2013-2014 & 2014-2015				
Year	**Degree**	**Program Area**	**Agency**	**Preceptor Name**

Abstract

Assessing the Impact of Restrictions to Medicaid Coverage of Methadone and Buprenorphine on Opioid Users' Access to and Utilization of Substance Use Treatment

by

Adviser: Professor William T. Gallo

Opioid use and dependence have increased dramatically since the early 2000s. As of 2013, an estimated 2.4 million people were considered to be dependent on opioids. Medication assisted treatment (MAT), such as methadone and buprenorphine, is the most effective form of treatment for opioid dependence; yet, since 2002, MAT use has decreased steadily.

Medicaid is the largest purchaser of MAT in the United States; however, Medicaid coverage of MAT varies by state. As of 2008, fourteen states did not cover either methadone or buprenorphine, or both. This dissertation examines the factors associated with Medicaid coverage of methadone and buprenorphine, and explores the impact of this coverage on the length of time individuals waited to enter substance use treatment, and the extent to which Medicaid coverage of methadone is associated with MAT utilization.

This dissertation utilized a combination of individual-level, program-level and state-level data. Individual-level data came from the Treatment Episodes Data Set-Admissions (TEDS-A). Program-level data were obtained from the Uniform Facility Data Set (UFDS) and the National Survey of Substance Abuse Treatment Services (N-SSATS). State-level data regarding Medicaid coverage of MAT were obtained from three sources: (1) McCarty et al's study, "Methadone Maintenance and State Medicaid Managed Care Programs"; (2) Ducharme at al's study, "State policy influence on the early diffusion of buprenorphine in community treatment programs"; and, (3) the State Financing for Medication Assisted Treatment study.

The main findings of this study indicate that state wealth is correlated with Medicaid coverage of MAT, Medicaid coverage of MAT is associated with an increase in treatment wait time and Medicaid coverage of methadone is associated with greater odds of MAT use. This dissertation did not include any analyses since the passage of the Patient Protection and Affordable Care Act (PPACA), which in 2014, required that all public and private health insurance programs cover substance use treatment services. While this prioritization will undoubtedly increase access to substance use treatment, not all services must be covered. Given this, variability in the accessibility of treatment will likely persist. Further research should continue to monitor the accessibility and utilization of substance use treatment, with particular focus on MAT.

Acknowledgements

I would like to express my appreciation to those individuals that have helped make this dissertation possible.

I am immensely grateful to Drs. William T. Gallo and Nancy Sohler for their guidance and support throughout my graduate studies. Their encouragement has allowed me to grow and their humor and patience have kept me sane. I would also like to thank Drs. Nicholas Fruedenberg and Jonathan Prince for their time, attention and support throughout the conception and writing of this dissertation.

To my family, NAMES REDACTED, my love and gratitude for each of you is endless. Your constant support and expressions of admiration kept me going through the most difficult periods of this program and dissertation. I look forward to having more time to relax, laugh and hug you all!

To my Mom, Dad and brother, NAME REDACTED, thank you for always being there, for always believing in me and for always being proud of me. Your support has been essential and your love has been a gift.

Chapter 1: Introduction and Objectives

Dependence on opioids, including heroin and prescription pain relievers, has increased significantly in the United States over the last decade.[1] Between 2002 and 2013, the number of individuals considered to be opioid dependent grew 41% from approximately 1.7 million to 2.4 million people.[2,3] As opioid dependence has increased, so has the utilization of substance use treatment services. Between 2002 and 2012, the proportion of admission to substance use treatment programs for individuals reporting opioid use increased from 18% to 26%.[1]

Broadly speaking, there are two types of treatment for opioid dependence: (1) drug-free inpatient/outpatient, which includes inpatient hospitalization and rehabilitation programs, as well as outpatient programs such as 12-step programs; and, (2) medication assisted treatment (MAT), which included methadone and buprenorphine. MAT is the most effective form of substance use treatment for opioid dependence.[4,5] MAT, such as methadone and buprenorphine, suppresses the analgesic effect that opioids produce, as well as reduces withdrawal symptoms associated with opioid dependence.[6] Despite evidence supporting MAT as the most effective form of treatment for opioid dependence, only 28% of heroin dependent individuals and 18% of other opioid dependent individuals used MAT in 2012.[1]
In the United States, Medicaid beneficiaries represent the largest group of opioid dependent individuals, and Medicaid is the largest purchaser of buprenorphine and methadone.[7,8] As a result, Medicaid coverage of opioid treatment services has the potential to impact a large proportion of individuals with opioid dependence in the United States. As a combined state/federal program, state Medicaid programs have significant latitude in determining coverage for optional benefits, including some types of substance use treatment. As a result, Medicaid coverage of substance use treatment services varies significantly by state. For MAT, state variability ranges from full, unrestricted coverage, to partial coverage which includes restrictions such as pre-authorization requirements or lifetime limits on MAT use, and in some states, neither methadone nor buprenorphine are covered at all.[9]

This study seeks to gain a better understanding of the factors that influence Medicaid coverage of MAT, and whether coverage of MAT is associated with increased access to methadone and buprenorphine treatment. To understand the factors that influence Medicaid coverage of MAT, I examine two main categories of predictors: economic and need factors. Examples of economic factors include: state Federal Medical Assistance Percentages (FMAP) rate, percent of total residents that are Medicaid beneficiaries, per capita income, state expenditures, and the amount of funding that is received through federal block grants for substance use treatment services. Need factors include the number of substance use treatment facilities and the number of opioid dependent individuals in each state.

To gain a better understanding of the relationship between Medicaid coverage of MAT and the accessibility of substance use treatment for opioid dependent individuals, I examine the associations between Medicaid coverage of methadone and buprenorphine and the amount of time individuals seeking treatment are required to wait prior to treatment entry, as well as Medicaid coverage of methadone and MAT utilization.

Dissertation Specific Aims

The specific aims for this dissertation project are:

Aim 1: Identify state-level factors that are correlated with Medicaid coverage of methadone and buprenorphine

Aim 1a:

Assess whether state-level economic factors such as Federal Medical Assistance Percentages (FMAP), percent of total residents that are Medicaid beneficiaries, per capita income, and

amount of funding received through federal block grants for substance use treatment services are correlated with Medicaid coverage of methadone and buprenorphine.

Aim 1b:

Assess whether the need for opioid treatment, measured by the number of substance use treatment facilities and the number of opioid dependent individuals, is correlated with Medicaid coverage of methadone and buprenorphine.

Aim 2: Determine whether individuals enrolled in substance use treatment in states with Medicaid coverage of methadone or buprenorphine experience decreased wait times for substance use treatment entry, as compared with individuals enrolled in substance use treatment in states with no Medicaid coverage of methadone or buprenorphine.

Aim 3: Determine whether opioid dependent individuals seeking substance use treatment in states with Medicaid coverage of methadone are more likely to utilize medication assisted treatment, as compared to opioid dependent individuals seeking substance use treatment in states without Medicaid coverage of methadone.

Dissertation Overview

The following paragraph provides an overview of the chapters included in this dissertation.

In Chapter 2, Background and Significance, I provide a review of the literature related to each study aim. I also include an overview of the public health burden of opioid dependence, current treatments for opioid dependence and Medicaid coverage of MAT. In Chapter 3, Data and Measures, I describe the data sources used in each aim of this study, the methods for creating the analytic samples and the methods used to handle missing data. In Chapter 4, I review the theoretical framework used to guide the construction of Aim 1 and the addition of state-level predictor variables utilized in Aims 2 and 3. In Chapters 5, 6 and 7, I describe the findings from each of the three analyses. Finally, in Chapter 8, I review

the limitations of the study, synthesize the findings across study aims and discuss the relevance of these findings within the policy context of current day Medicaid coverage of substance use treatment in the United States.

Chapter 2: Background and Significance

This dissertation has two primary objectives: (1) to understand the factors associated with state Medicaid coverage of methadone and buprenorphine, the primary medications used to treat opioid dependent individuals; and, (2) to demonstrate the impact of this coverage on the accessibility of substance use treatment. To achieve this, three separate analyses have been conducted. The first analysis, described in greater detail in Chapter 5, examines the association between state-level factors representing the economic situation of the state and the need for treatment within a state, and Medicaid coverage of methadone and buprenorphine. The remaining two analyses focuses on understanding the impact of Medicaid coverage of methadone and buprenorphine on individuals seeking substance use treatment. The first of these two analyses, described in detail in Chapter 6, investigates the association between Medicaid coverage of methadone and buprenorphine (examined separately) and the amount of time individuals wait to enter substance use treatment. The second analysis, detailed in Chapter 7, explores the association between Medicaid coverage of methadone and the utilization of MAT.

This chapter provides an overview of the literature related to these analyses, including the public health significance of opioid dependence in the United States, a review of treatment for opioid dependence, with a detailed description of MAT, and a review of the current literature regarding utilization of MAT in the United States.

Public Health Burden of Opioid Dependence

Opioid dependence, whether the result of nonmedical use of prescription opioids such as

Oxycodone and Hydrocodone, or heroin use, poses a significant public health problem in the United States as it has been linked to drug overdose, polydrug use, sexual risk behaviors for HIV and other infectious diseases, and injection drug use.[10–15] In 2013, 4.5 million Americans reported nonmedical use of prescription opioids within the previous twelve months, the second most frequently used illicit drug category behind marijuana.[16]

While nonmedical use of prescription opioids remains significant, recent trend data indicate that it is decreasing in the United States.[16] Heroin use, however, has been steadily increasing.[17–20] Between 2007 and 2013, there was a consistent increase in heroin use (within the past year) among persons 12 years or older.[16] Evidence suggests that the concurrent increase in heroin use and decrease in nonmedical prescription opioid use is the result of two factors: changes to the formulation of prescription opioids that made it more difficult to crush, and therefore inject and/or inhale prescription opioids, and the transition from nonmedical prescription opioid use to heroin use among prescription opioid dependent individuals.[21–23] Similar to prescription opioids, heroin dependence has significant health consequences, including HIV and hepatitis C infection, drug overdose, injection drug use, bacterial and soft tissue infections such as endocarditis and cellulitis, as well as unsafe sex and drug behaviors.[24–31]

Opioid dependence, whether the result of prescription opioid or heroin use, carries a significant monetary cost. Health care costs associated with opioid dependence are considerable, at approximately $25 billion, and the overall societal costs due to opioid dependence, including health care costs, incarceration and workplace costs such as lost employment, are estimated at $55.7 billion.[32]

Treatment for Opioid Dependence

The increase in heroin use and continued high rate of nonmedical use of opioids in the United States has resulted in a substantial increase in the use of substance use treatment. Between 2002 and 2013, the number of individuals seeking treatment for heroin increased from 277,000 to 526,000 and from

360,000 to 746,000 for prescription opioid users.[16]

Broadly speaking, there are two main categories of treatment currently available for opioid dependence: drug-free inpatient/outpatient treatment, which includes inpatient therapeutic communities and outpatient support groups (primarily focused on abstinence); and medication-assisted treatment (MAT), which includes methadone, buprenorphine and naltrexone. Of these forms of treatment, methadone and buprenorphine are the most effective approach to treating opioid addiction. These two treatments are the focus of this dissertation.[4,5]

Medication Assisted Treatment

Opioids stimulate feelings of euphoria, drowsiness and decreased anxiety by binding to and activating opioid receptors in the body.[33] Medications used to treat opioid dependence are classified by their effect on these receptors. Opioid agonists, such as heroin, codeine and methadone, both bind to and activate these receptors, allowing users to experience feelings of euphoria.[33] Opioid antagonists such as naloxone also bind to these receptors, but they block the euphoric effects of these drugs, and have the potential to reverse the effects altogether.[34] Naloxone, for example, is used to reverse opioid overdoses by removing opioid agonists from these receptor sites, effectively putting the patient in a state of withdrawal. Finally, between the categories of agonists and antagonists are partial agonists, such as buprenorphine. Partial opioid agonists bind to opioid receptors, providing some agonist effects but these effects are limited by the antagonist properties.[34]

Methadone and buprenorphine are particularly effective at suppressing withdrawal symptoms, due to their agonist properties, while simultaneously creating blocking effects for other opioids, such as heroin.[35] These medications create a tolerance to opioids which, over time, lessens the effect of other opioids.[36] This quality is an important benefit for the treatment of opioid dependence because it can reduce the likelihood of sustained or increased use of other opioids.

Methadone and buprenorphine have long half-lives, or lasting effects, making them ideal for the treatment of opioid dependence. Heroin has a half-life of approximately two to three hours, at which point opioid receptors begin to empty and the user begins to feel symptoms of withdrawal. In contrast, the half-life of methadone ranges from 16-48 hours and approximately 24 hours for buprenorphine.[33,36,37] The extended half-lives of these medications make them particularly effective at reducing cravings by staving off withdrawal symptoms between doses.

Both methadone and buprenorphine can be used in detoxification and maintenance treatment. Methadone maintenance, as compared with inpatient detoxification, has been shown to retain patients for longer durations and is associated with significantly less heroin use than individuals utilizing inpatient detoxification.[5] Additionally, methadone maintenance treatment has been associated with reductions in HIV incidence, mortality, injection drug use, syringe sharing, and slower progression of HIV disease, and is safe for treating opioid dependence in pregnant women.[38–46] Buprenorphine, while not as effective as methadone treatment overall, is more effective at retaining heroin users in substance use treatment than users receiving a placebo.[4,47,48]

MAT Provision and Utilization

In the United States, methadone is administered through opioid treatment programs (OTPs) that are certified and regulated by the Substance Abuse and Mental Health Services Administration (SAMHSA).[49] OTP regulations are strict, particularly regarding the frequency of methadone dosing, requiring most patients to report to the clinic for dosing five to six days per week.[50] This highly regulated environment is considered, by some, to be stigmatizing and a barrier to recovery.[51–53]

Given the restrictive nature of methadone provision in the United States, the approval of buprenorphine for the treatment of opioid dependence in office-based settings was ground-breaking. In 2000, President Bill Clinton signed the Drug Addiction Treatment Act of 2000 (DATA 2000), a bill that

allowed for the expansion of medication assisted treatments to outpatient settings beyond methadone maintenance treatment programs. Two years later, buprenorphine was approved by the Food and Drug Administration for the treatment of opioid dependence. In addition to office-based settings, buprenorphine can also be provided at methadone clinics and community based treatment programs by qualified physicians.[54] Evidence suggests that buprenorphine users are demographically different than methadone users, and include individuals residing in rural areas and users of prescription opioids, two factors which may help to expand the reach of MAT.[55]

Both the provision of MAT by substance use treatment programs and providers and the utilization of MAT by opioid dependent individuals is limited in the United States.[9,49,55–58] In 2010, 8% of all substance use treatment facilities in the United States provided MAT, and these programs served approximately one-quarter of all individuals attending substance use treatment.[59] Further, despite the increase in the use of substance use treatment among opioid dependent individuals over the last decade, MAT use decreased by 7%.[1]

Low MAT utilization is influenced by factors at several levels, including those related to individuals, organizations/providers as well as systems-level factors. At the individual-level, cocaine injecting or crack smoking[60,61], homelessness[62], recent or previous incarceration[61,62], injection drug use[60–62], previous negative experiences with MAT[63–65], stigma associated with MAT, particularly methadone[65–69] and the punitive treatment structure of methadone programs[70] have been negatively associated with MAT utilization. Individual-level factors found to be positively associated with MAT use include being female[61,62,71], married[71], having Medicaid coverage[62], heroin use[60,62,64], older age[61,62] and having previously been in substance use treatment[60,71].

The literature regarding the factors associated with the availability of MAT is largely focused on organizational-level factors of substance use treatment facilities. Factors positively associated with MAT

provision include large organizational size[54,72,73], receipt of public funding[54,58,72], awareness of Medicaid and/or state contract policies regarding coverage[74], having a physician on staff[58,72], public versus private ownership[54,72], and whether the program is located within a hospital setting[54,73,75]. In contrast, negative staff perceptions of methadone and/or buprenorphine and treatment ideology, particularly those that follow 12-step philosophy, have been negatively associated with MAT provision.[76–78]

Provider-level barriers regarding the dispensing of MAT in the United States are focused on buprenorphine given that methadone can only be dispensed in certified substance use treatment facilities. Barriers to providing buprenorphine, as cited by potential or actual buprenorphine providers, include: insurance coverage/reimbursement concerns[79–81], negative perceptions of substance users and/or buprenorphine[81–83], lack of expertise or necessary training[79–81,84–86], lack of time[79,81,83,85]and lack of support[79–81,84,85,87].

Finally, the perspective least explored is the role of systems or state-level factors in methadone or buprenorphine provision, which is part of the focus of this dissertation. Factors such as local zoning restrictions that prohibit mobile dispensing of methadone and/or buprenorphine[88], lack of support by state agencies for methadone and/or buprenorphine[74,88], lack of state Medicaid coverage of methadone and/or buprenorphine[54,89] and buprenorphine prescribing regulations that require pre-authorization by some insurance companies[88] have all been found to be negatively associated with MAT provision. Two important positive associations must be noted, both of which have been found in research investigating the adoption of naltrexone. Both higher state public assistance expenditures (per capita) and the prevalence of alcohol abuse or dependence were positively associated with naltrexone adoption.[89] These findings suggest that states with a greater need for substance use treatment and those that are more invested in safety net programs are more likely to adopt naltrexone. These findings are novel and have yet to be explored with respect to methadone and buprenorphine provision.

The findings regarding state-level barriers and facilitators of methadone and buprenorphine demonstrate the important role that states play in setting the tone for the way these treatments are perceived. States have the authority to direct public funds toward or away from treatment programs; therefore, a state's endorsement (or rejection) of a given treatment modality or approach can have significant impact on the extent to which substance use treatment programs adopt treatment options such as methadone and buprenorphine. To date, we are unaware of any research that has investigated the relationship between structural factors such as Medicaid coverage of MAT, and the use of MAT by opioid dependent individuals.

Treatment Wait Time

Chapter 6 describes the findings from an analysis of the factors associated with substance use treatment wait time entrance and Medicaid coverage of methadone and buprenorphine. This analysis was not limited to individuals receiving treatment in programs providing MAT; rather, this association was explored among individuals across all modalities of substance use treatment. Therefore, this section provides a review of the literature related to wait time across substance use treatment modalities. Treatment wait time is often reported as one of the most significant barriers to enrolling in substance use treatment.[90–94] The average time individuals wait to enter substance use treatment ranges from zero days, particularly in cities such as San Francisco and Baltimore that employ a treatment on demand model[95], to one week[96–99], 3 weeks[100,101] and over one month[91,96,102,103]. Delays in treatment entry have been associated with a lack of treatment enrollment[91,104,105], shorter periods of treatment engagement[98], an increased risk of mortality[106], arrest[107], untreated psychiatric problems[108], HIV[109], and a return to or initiation of injection drug use (IDU)[110]. Finally, an inverse relationship between wait time and treatment entry has been observed in several studies, such that the longer a person waits to enter treatment, the less likely they are to enroll in it.[92,95,111–113]

Methadone, in particular, has been associated with an increase in waiting time for treatment entry.[114–116] Andrews et al found that individuals initiating methadone treatment were three times more likely to wait one month or more to enter treatment as compared with individuals waiting to enter other outpatient programs.[116] Gryczynski et al also found significant delays for individuals seeking methadone treatment, as compared with other treatment modalities. In their study, less than one quarter of individuals enrolling in methadone treatment were able to begin treatment within four months of initiating contact with a program.[103]

The literature regarding substance use treatment wait time is largely focused on factors related to individuals and organizations. Individual-level factors such as unemployment[96], homelessness[96], being African American[103,116], cocaine use[103,106] and psychiatric problems[103] have all been associated with longer wait times for treatment entry. The associations between age[96,106,117] and gender [100,102,105] and treatment wait time have been inconsistent.

Organizational factors, particularly regarding program inefficiencies, are believed to contribute most significantly to wait times.[90,98,118–121] In fact, in the Treatment Episodes Data Set (TEDS), which was the main dataset utilized for the analysis of wait time, substance use treatment programs were directed to calculate treatment wait times as "the number of days the client must wait to begin treatment because of program capacity, treatment availability, admissions requirements, or other program requirements. It should not include time delays caused by client unavailability or client failure to meet any requirement or obligation".[122] Specific organizational factors associated with delays to treatment entry include larger client caseload[96,123], staff shortages,[92] provision of methadone[116], inefficient phone scheduling systems[99], central intake units[94] and increased proportion of clients receiving public assistance[123]; whereas forprofit programs[117], programs with an increased number of patients attending daily[96] and programs with performance contracting[101], or financial incentives for improvement in patient outcomes or organizational efficiencies, have been associated with reduced treatment wait times.

Structural level factors have been the least explored with regard to treatment wait times. Factors such as bureaucratic delays related to processing court-ordered treatments[94,96] and a lack of insurance[94] have been associated with increased wait times for treatment entry.

Medicaid Coverage of Methadone and Buprenorphine

Medicaid is a combined federal/state program that provides health insurance for low-income individuals and families. The federal government offers guidelines to states regarding the extent to which medical services and medications should be covered by Medicaid. Ultimately, however, each state creates their own eligibility requirements, as well as coverage parameters for medical care and medications.[124] Prior to 2014, substance use treatment was considered an optional benefit under federal Medicaid guidelines, meaning that states were not required to cover it beyond detoxification. As a result, there was significant state variability in the extent to which substance use treatment was covered, particularly regarding methadone and buprenorphine. In some states, for example, neither buprenorphine nor methadone was covered by Medicaid; however, in other states Medicaid covered one or both medications as long as they were provided in specific settings or after physicians obtain preapproval. As of 2008, the most recent year utilized in the analyses for this dissertation, 19 states had some form of restriction on the coverage of buprenorphine and/or methadone.[9]

Medicaid is the largest purchaser of both buprenorphine and methadone and Medicaid beneficiaries represent the largest group of opioid dependent individuals in the United States.[7,8] According to the National Survey on Drug Use and Health (NSDUH), approximately 14% of Medicaid beneficiaries have a substance use disorder, as compared with 10% of the general population.[125] Given this, Medicaid coverage of substance use treatment services has the potential to impact a significant number of individuals in the United States. In the remaining chapters of this dissertation, the results of three analyses will be presented related to Medicaid coverage of MAT, including (1) the factors correlated with

Medicaid coverage of MAT, (2) the association between Medicaid coverage of methadone and buprenorphine and treatment wait time, and (3) the association between Medicaid coverage of methadone and the utilization of MAT.

Chapter 3: Data and Methods

This dissertation includes both state-level (Aim 1) and individual-level (Aims 2 and 3) analyses of datasets that were compiled using multiple sources. In this chapter, I provide a description of each dataset, including a detailed explanation of each data source and the variables contained within, a description of how each analytical sample was created and the techniques used to handle missing data and the validation of study findings.

Data Sources and Variable Description

Individual-level Data

The primary data source for this dissertation was the Treatment Episodes Dataset-Admissions (TEDS-A). The TEDS-A is an administrative data set composed of annual admissions of individuals 12 years of age and older to substance use treatment programs in the United States that are licensed or certified by State agencies.[126] TEDS-A is primarily composed of admissions to substance use treatment programs that receive public funds; however, some states also require non-publicly-funded programs to report demographic and treatment-related data, and therefore may be included in TEDS-A. Substance use treatment programs that are not likely to be contained within TEDS-A include programs that are not licensed by the State, including some hospitals, private-for-profit programs and programs operated by the Bureau of Prisons, the Department of Defense and the Veterans Administration.[126]

TEDS-A data are publicly available for download through the Substance Abuse and Mental Health

Data Archive (SAMHDA), which is maintained by SAMHSA and available through the Institute for Social Research (ISR) website at the University of Michigan.[127] TEDS-A includes a mixture of self-reported and program-reported demographic characteristics such as gender, age group, race/ethnicity, among other variables, and treatment-related variables such as substances of abuse, substance use treatment history and treatment program type. While TEDS-A provides individual-level data for substance use treatment episodes, these data describe encounters with substance use treatment, rather than individual clients. For example, if the same individual has entered substance use treatment four times within a calendar year, there will be four separate treatment episodes counted in TEDS-A, not one.

TEDS-A Variables

All individual-level variables in Aims 2 and 3 came from the TEDS-A. Below is a description of each variable, as well as an explanation of any recodes that were made to them.

TEDS-A – Independent Variables

Age: When initially collected by programs, age was a continuous variable. However, when the TEDS-A is cleaned for public use, SAMHDA recodes age into a categorical variable in order to protect the ages of the youngest and oldest individuals in substance use treatment. The resulting age categories by years are: 12-14, 15-17, 18-20, 21-24, 25-29, 30-34, 35-39, 40-44, 45-49, 50-54, 55 and over.

In Aim 2, based on the age distribution of the sample, age was recoded and dummy coded in the following manner: Less than 18, 18-24, 25-34, 35-44 and 45 and over. In Aim 3, based on the distribution of the sample, which had fewer very young individuals, age was recoded and dummy coded as: Less than 25, 25-34, 35-44 and 45 and over.

Male: In the original dataset, sex was coded as 1 for males and 2 for females. Sex was recoded for all analyses in this dissertation to female=0 (referent group) and male=1.

Race: The original race variable included 9 categories: Alaska Native, American Indian, Asian or Pacific Islander, Black or African American, White, Asian, Other single race, Two or more races (only for 2006 and 2008 TEDS-A), Native Hawaiian or other Pacific Islander. Based on the distribution of the sample, race was dummy coded into three main categories: White (referent group), Black and Other Race(s).

Hispanic: TEDS-A provided 6 options for ethnicity: Puerto Rican, Mexican, Cuban, Other specific Hispanic, Not of Hispanic Origin and Hispanic, specific origin not specified. Ethnicity was dummy coded into a binary variable where Puerto Rican, Mexican, Cuban, Other specific Hispanic and Hispanic, specific origin not specified became Hispanic=1, and individuals not of Hispanic origin were coded as Hispanic=0 (referent group).

Married: Marital status contained 4 original categories: never married, now married, separated and divorced/widowed. Based on the distribution of these categories, marital status was recoded into a binary variable where never married and divorced/widowed became married=0 (referent group) and married and separated individuals became married=1.

Marital status was a supplemental variable in TEDS-A, and therefore was not reported by every program. In the final Aim 2 dataset, before any missing data techniques were used, the largest amount of missing data for marital status in any one year or combined year, for either methadone or buprenorphine, was 27%. In the final Aim 3 dataset, before any missing data techniques were employed, the largest amount of missing data for marital status in any of the methadone analyses was 23%. High School Ed: The original TEDS-A variable education contained 5 categories: 8 years or less, 9-11 years, 12 years, 13-15 years and 16 or more years. Education was recoded into a binary variable where 12 or more years of education became high school education=1 and less than 12 years became high school education=0 (referent group).

Employed: This variable reflects the employment status of individuals at the time of enrollment in a treatment program. The original employment categories were: full-time, part-time, unemployed and not

in labor force. This variable was recoded into a binary variable where individuals working full or parttime were recoded as 1 and those individuals that were unemployed or not in the labor force were recoded as 0 (referent group).

Unstable Housing: This variable describes the living arrangement of individuals at the time of treatment entry. The original variable contained 3 categories: homeless, dependent living (individuals living in a residential facility, halfway house, group home or children less than 18 years of age who are living with parents, relatives, guardians or in foster care), and independent living (individuals living alone or with others without any supervision, including individuals 18 and older who live with their parents). Living arrangement was recoded to reflect unstable housing, where homeless and dependent living individuals were coded as 1 for unstably housed and individuals who were living independently were coded as 0 for unstably housed (referent group).

Living arrangement was a supplemental variable, and therefore not reported by every program. In the Aim 2 analyses before any missing data techniques were used, the largest amount of missing data for this variable in any one year or combined year, for either methadone or buprenorphine, was 12%. In the Aim 3 analyses before any missing data techniques were employed, the largest amount of missing data for this variable in any of the methadone analyses was 32%.

Primary Source of Income/Support: This variable describes the primary source of income, and for individuals under 18 years of age, the parent's primary source of income at the time of treatment admission. This variable was dummy coded using the original categories: wages/salary (referent group), public assistance, retirement/pension, disability, other and none. The primary source of income/support variable was also a supplemental variable, and therefore not reported by every program. In the final Aim 2 dataset, before any missing data techniques were used, the largest amount of missing data for any category of primary source of income in any one year or combined year, for either methadone or buprenorphine, was 45%. In the final Aim 3 dataset, before any missing data techniques were employed,

the largest amount of missing data for any category of primary source of income in any of the methadone analyses was 60%.

Treatment Program Type: This variable describes 8 treatment types and/or settings in which treatment was provided. A description of each category follows, as well as an explanation of the recoded variable.

1. Detoxification/24 hour service/Hospital inpatient – Hospital settings in which acute care medical detoxification services were provided 24 hours per day for persons who might experience withdrawal complications.
2. Detoxification/24 hour service/Free-standing Residential – Non-hospital settings in which 24 hour per day care is provided for safe withdrawal and transition to ongoing treatment.
3. Rehabilitation/Residential-Hospital (Other than Detox) – Treatment services for alcohol or drugs that were provided within a hospital setting and included 24 hour per day medical care.
4. Rehabilitation/Residential-Short Term (30 days or fewer) – Non-acute care treatment services for alcohol or drugs for 30 days or less.
5. Rehabilitation/Residential-Long Term (More than 30 days) – Non-acute care treatment services for alcohol or drugs for longer than 30 days. This category includes programs such as halfway houses.
6. Ambulatory-Intensive Outpatient – Outpatient programs in which clients received at least two hours of treatment per day, for at least three days per week.
7. Ambulatory-Non-Intensive Outpatient – Outpatient programs in which clients received individual, family or group services. This category includes programs that provided MAT.
8. Ambulatory-Detoxification – Outpatient treatment programs in which clients received services and/or MAT to withdraw from alcohol or drugs.

In the Aim 2 dataset, treatment program type was recoded into three main categories of programs: detoxification, outpatient and rehab (referent). Detoxification/24 hour service/Hospital inpatient, Detoxification/24 hour service/Free-standing Residential and Ambulatory-Detoxification were recoded to detox=1 (all others=0). Rehabilitation/Residential-Hospital (Other than Detox), Rehabilitation/Residential-Short Term (30 days or fewer) and Rehabilitation/Residential-Long Term

(more than 30 days) were recoded to rehab=1 (all others=0). Ambulatory-Intensive Outpatient and Ambulatory-Non-Intensive Outpatient were recoded to outpatient=1 (all others=0).

In the Aim 3 dataset, because of the distribution of programs, treatment program type was recoded so that Rehabilitation/Residential-Short Term (30 days or fewer) and Rehabilitation/Residential-Long Term (More than 30 days) became rehab=1 and all other programs were rehab=0.

Number of Substances Using: This variable indicates the number of substances that a person reported using at the time of treatment admission. The original variable had 4 categories, ranging from 0-3, to reflect the primary, secondary and tertiary substances used. This variable was dummy coded with 3 substances as the referent category. In the Aim 2 buprenorphine analysis and the Aim 3 analysis, there were no individuals reporting 0 substances of abuse during each of the study years so only one, two and three substances of abuse were used in these analyses.

IDU: This binary variable reflects whether a person reported injecting either their primary, secondary or tertiary substance of abuse at the time of admission.

Cocaine: This binary variable reflects whether cocaine was reported as the primary, secondary or tertiary substance of abuse at admission.

Heroin: This binary variable reflects whether heroin was reported as the primary, secondary or tertiary substance of abuse at admission.

Non-prescription Methadone: This binary variable reflects whether non-prescription methadone was reported as the primary, secondary or tertiary substance of abuse at admission.

Synthetic Opioids: This binary variable reflects whether synthetic opioids were reported as the primary, secondary or tertiary substance of abuse at admission.

Benzodiazepines: This binary variable reflects whether benzodiazepines were reported as the primary, secondary or tertiary substance of abuse at admission.

Any opioid use: This binary variable was created by combining the heroin, synthetic opioid and nonprescription methadone use variables, so that if a person reported using any of these drugs, opioids was coded as 1, and if they did not report using any one of them, opioids was coded as 0.

Psychiatric Problem: This binary variable indicates whether an individual has a psychiatric problem, as identified through self-report and/or program report. The psychiatric problem variable was a supplemental variable, and therefore was not reported by every program. In the final Aim 2 dataset, before any missing data techniques were used, the largest amount of missing data for psychiatric problem in any one year or combined year, for either methadone or buprenorphine, was 26%. In the final Aim 3 dataset, before any missing data techniques were employed, the largest amount of missing data for any category of primary source of income in any of the methadone analyses was 29%. Primary Health Insurance Type: This variable indicates the primary type of health insurance coverage a person had at the time of treatment admission. The original variable was categorical but was dummy coded for these analyses using the original categories: private insurance (referent group), Medicaid, Medicare and none. Health insurance was a supplemental variable, and therefore was not reported by every program. In the final Aim 2 dataset, before any missing data techniques were used, the largest amount of missing data for any category of client insurance coverage in any one year or combined year, for either methadone or buprenorphine, was 50%. In the final Aim 3 dataset, before any missing data techniques were employed, the largest amount of missing data for any category of client insurance coverage in any of the methadone analyses was 54%.

TEDS-A – Dependent Variables

Days Waiting to Enter Treatment: This continuous variable was the outcome variable used in Aim 2. Treatment wait time reflects the number of days between a person's first contact with a program and their date of admission or receipt of their first clinical service. Treatment wait time reflects delays in

treatment entry due to program capacity, treatment availability, admission requirements or other requirements related to the program. Programs are directed to not report any delays in treatment entry that are caused by the unavailability of the client. The range of possible values for treatment wait time was 0 to 996 days.

Days waiting to enter treatment was a supplemental variable, and therefore was not reported by every program. In the final Aim 2 dataset, before any missing data techniques were used, the largest amount of missing data for treatment wait time in any one year or combined year, for either methadone or buprenorphine, was 24%.

Enrolled in MAT: For the Aim 3 analyses, the TEDS-A Medication Assisted Treatment variable was the outcome variable of interest. This binary variable indicated whether methadone or buprenorphine were part of an individual's treatment plan. This variable does not, however, specify which of the two MATs, methadone or buprenorphine, was used. The variable was coded as yes=1 and no=2 and was recoded to enrolled in MAT=1 and not enrolled in MAT=0.

Structural Variables

Variables representing the state economic environment and need for substance use treatment within a state were utilized in Aim 1 of this study to investigate the correlation between two sets of factors, economic and need, and Medicaid coverage of methadone and buprenorphine. Some of the state-level factors from the Aim 1 analyses were included in the analyses for Aims 2 and 3 as fixed effects estimators to help account for the unobserved heterogeneity of the state environment. A description of each structural variable follows.

Federal Medical Assistance Percentages (FMAP): The Federal Medical Assistance Percentage is the proportion of funds that the federal government contributes to each state's Medicaid program. The

FMAP varies by state and is largely based on the per capita income of the state.[128] On average, the FMAP rate is 57%, meaning that the federal government pays 57% of Medicaid costs. While the FMAP rate is never lower than 50%, in 2013 it was over 70% for Arkansas, the District of Columbia, Idaho, Kentucky, Mississippi, South Carolina and West Virginia.[129] The FMAP rate is reassessed every three years in order to account for changes in a state's overall wealth. FMAP rates for this study were obtained for fiscal years 1998, 2006 and 2008 from the Department of Health and Human Services.[130] The fiscal year covers the period of October 1, 1997 – September 30, 1998, October 1, 2005 – September 30, 2006 and October 1, 2007 – September 30, 2008.

State Expenditures: State expenditure data were obtained from the National Association of State Budget Officers.[131–133] Some of the broad expense categories that are included in the annual state expenditure total are: education, public assistance, Medicaid, corrections, transportation and capital expenses. State expenditure totals were obtained for fiscal years (July 1-June 30) 1998, 2006 and 2008.

Percent of Residents Receiving Medicaid: Data regarding Medicaid beneficiaries were obtained from the Centers for Medicaid and Medicare (CMS), Medicaid Statistical Information System.[134–136] The total number of beneficiaries was obtained for each state and was then divided by each state's estimated population total (data obtained from the United States Census Bureau[137]), and then multiplied by 100. Medicaid beneficiary data were obtained for 1999 (1998 Medicaid beneficiary data were not available), 2006 and 2008.

Per Capita Income: Per capita income data were obtained from the United States Department of Commerce, Bureau of Economic Analysis for 1998, 2006 and 2008.[138] The per capita income in each state is calculated by summing the total personal income for all state residents, divided by the total midyear population, as estimated by the United States Census Bureau.

Substance Abuse Prevention and Treatment Block Grant (SABG) funding: SABG funds provide states with the opportunity to address their substance use prevention and treatment needs in ways that are unique

to their individual communities. The amount each state receives is dependent upon population size, the total personal income for state residents and the amount of taxable resources in a state.[139] SABG data were obtained from the Substance Abuse and Mental Health Services Administration for fiscal years 2006 and 2008 (1998 data were not available).[140] Data used for this study were limited to substance use treatment block grant funds, excluding state funding that was obtained for substance use prevention.

Rate of Individuals in Opioid Treatment: To calculate the opioid treatment rate, the number of opioid dependent individuals in 1998, 2006 and 2008 were obtained from the TEDS-A. TEDS-A data were limited to individuals reporting opioids as their primary, secondary or tertiary substance of abuse. To standardize the number of opioid dependent individuals seeking treatment across states, an opioid treatment rate of opioid dependent individuals per 10,000 population was calculated based on the number of opioid dependent individuals and the population of each state.

Methadone and Buprenorphine Program Rate: The number of opioid treatment programs were obtained from the Uniform Facility Data Set (UFDS) for 1998, and the National Survey of Substance Abuse Treatment Services (N-SSATS), formerly known as the UFDS, for 2006 and 2008.[141] The UFDS and N-SSATS include all private and publicly funded substance use treatment programs in the United States. The UFDS and N-SSATS data used for this study were limited to the total number of programs providing methadone in 1998 or 2008 and buprenorphine in 2006 and 2008. In order to standardize the number of programs per state, a program rate of programs per one million population was calculated based on the number of methadone and buprenorphine programs (calculated separately) and population of each state.

Medicaid Coverage of Methadone: State Medicaid coverage of methadone for 1998 and 2008 was obtained from two sources. For 1998, data were obtained from McCarty et al's article, "Methadone Maintenance and State Medicaid Managed Care Programs".[142] This article describes the results of a cross-sectional study of Medicaid coverage restrictions for methadone in each state in the U.S. in 1998.

For 2008, state Medicaid coverage of methadone was obtained from the State Financing for Medication Assisted Treatment study, which includes cross-sectional data on Medicaid coverage of both methadone and buprenorphine.[9] For both study years, Medicaid coverage of methadone was dichotomized as yes/no.

Medicaid Coverage of Buprenorphine: State Medicaid coverage of buprenorphine in 2006 was gathered from Ducharme at al's article, "State Policy Influence on the Early Diffusion of Buprenorphine in Community Treatment Programs", which describes the results of a cross-sectional investigation of the organizational factors associated with state policy restrictions of Medicaid coverage of buprenorphine.[54] Similar to the 2008 data used for methadone, data for Medicaid coverage of buprenorphine in 2008 were obtained from the State Financing for Medication Assisted Treatment study. Similar to methadone, Medicaid coverage of buprenorphine was dichotomized as yes/no for both 2006 and 2008.

Construction of Analytic Samples

Each study aim utilized a different sample based on available data for the predictors and outcome of interest in the study analyses. This section describes how each analytic sample was derived.

Aim 1

The Aim 1 dataset was developed by gathering state-level data for Medicaid coverage of methadone and buprenorphine, FMAP rates, percent of residents receiving Medicaid, per capita income, total state expenditures, SABG, rate of opioid dependent individuals in treatment and rate of methadone and buprenorphine programs. These data were entered into Microsoft Excel and were matched based on the state indicator variable. Matching was done for each state per study year. The final dataset was then exported to SAS 9.3 for analyses.

As a state-level exploration, the potential analytic sample for each analysis in Aim 1 began with N=50. Due to missing data on the outcome and/or main predictors of interest, the sample was then reduced in each study year and in the combined year analyses for both treatment types. As displayed in Figure 1.3, the 1998 methadone analysis was reduced to N=48, excluding Nevada and West Virginia due to missing data. In 2008, the methadone sample was reduced to N=44 due to missing data, excluding the District of Columbia, Mississippi, North Carolina, North Dakota, Rhode Island and Texas. Finally, in the combined year analysis for methadone, the final sample was N=92 after excluding the District of Columbia, Mississippi, North Carolina, North Dakota, Nevada, Rhode Island, Texas and West Virginia due to missing data in one or both study years. The unit of analysis for the combined year sample was stateyear.

Due to missing data on either the outcome variable or one of the predictor variables of interest, the 2006 buprenorphine sample was reduced to N=48, with Alaska and Georgia excluded from the analyses. The 2008 buprenorphine sample was limited to N=45 due to missing data from the District of Columbia, Mississippi, North Carolina, Rhode Island and South Carolina. Finally, the combined 2006-2008 buprenorphine sample, after excluding Alaska, the District of Columbia, Georgia, Mississippi, North Carolina, Rhode Island and South Carolina due to missing data, was limited to N=93. The unit of analysis for the combined year sample was state-year.

Aim 2

Two datasets were constructed for the Aim 2 analyses, one dataset for the 1998, 2008 and combined 1998-2008 methadone analyses, and one dataset for the 2006, 2008 and combined 20062008 buprenorphine analyses. Each dataset was primarily composed of individual-level data from the TEDS-A, as well as state-level predictors utilized in the Aim 1 analyses. Both datasets included the following individual-level variables: sex, race, ethnicity, education, marital status, employment status, living

arrangement, age, treatment program type, MAT use, psychiatric problems, reported drug use, including: heroin, cocaine, methamphetamines, non-prescription methadone, synthetic opioids, benzodiazepines, any opioids, the total number of substances reported at treatment admission, IDU, health insurance type and primary source of income. In addition to the aforementioned individual-level data from TEDS-A, the methadone dataset included the following structural factors: Medicaid coverage of methadone, state per capita income, state methadone program treatment rate, percent of individuals receiving Medicaid and rate of opioid dependent individuals engaged in substance use treatment. The buprenorphine dataset included the following structural predictors: Medicaid coverage of buprenorphine, per capita income, SABG, percent of individuals receiving Medicaid, buprenorphine program treatment rate, and rate of opioid dependent individuals engaged in substance use treatment. TEDS-A data were matched with these structural variables based on the state indicator variable. For instance, if the methadone treatment rate for NJ was 40.5, every individual receiving treatment in NJ would have 40.5 for the methadone treatment rate variable in the final dataset. This matching was done for each study year and the data were then merged into a final dataset that contained both study years. In the final combined dataset, the unit of analysis was person-year.

Methadone dataset

Figure 2A.1 describes the analytic sample sizes for the methadone analyses performed for Aim 2, as well as the steps in which the sample was restricted. The initial methadone dataset contained a total of 3,721,278 individuals for the combined 1998-2008 period, with 1,704,606 individuals for 1998 and 2,016,672 for 2008. Each sample year was restricted to fourteen states in which there were sufficient data available for the outcome of interest, main predictor variables and the combined year analyses. These fourteen states included: Arizona, Colorado, Florida, Hawaii, Idaho, Iowa, Kansas, Louisiana, Montana, New Hampshire, New Mexico, Ohio, South Carolina and Wyoming. The largest

amount of missing data for any one variable retained in the methadone dataset was 54%. Once the methadone sample was restricted to these fourteen states, there were 357,031 individuals in the 1998 dataset and

432,993 in the 2008 dataset.

Two different approaches, multiple imputation (MI) and listwise deletion (LD), were utilized to handle missing data in Aims 2 and 3 of this study [a more in-depth explanation of MI and LD is included later in this chapter]. MI was performed for each single study year (the combined study year sample size was too large). The MI sample, which was drawn from the fourteen state sample, was N= 1,364,735 for 1998 and N= 2,034,778 for 2008. For the LD analyses, each year and the combined year sample was restricted to only those individuals in which there were complete case data. The final LD sample was N=98,183 for 1998, N=162,242 for 2008 and a combined 1998-2008 sample of N=260,425.

Bootstrap Analysis (BA) was also conducted for each year and combined year dataset because it is known to produce stable, unbiased estimates that demonstrate good internal validity, which is crucial in large sample sizes[143] [a more in-depth explanation of MI and LD is included later in this chapter]. The BA models are presented as the final models for Aims 2 and 3.

Each BA consisted of an unrestricted random sample of individuals selected from each LD dataset. The initial BA samples were N=290 for 1998, N=243 for 2008 and N=259 for the 1998-2008 dataset. As part of the BA procedure, each sample was replicated in 100 separate datasets which were then combined to form a final sample. The final BA samples for the methadone analyses were N=29,500 for 1998, N=24,400 for 2008 and N=26,100 for the combined 1998-2008 dataset.

Buprenorphine Dataset

Figure 2B.1 depicts the various sample sizes for the buprenorphine analyses. The main, 2006-2008 combined year dataset contained 3,721,278 individuals, 1,914,338 from 2006 and 2,016,672. A similar process was used to subset the buprenorphine data as was used for the methadone dataset. For

the buprenorphine analyses, there were 24 states with sufficient data available for the outcome of interest, main predictor variables and the combined year analyses. These states included: Arizona, Arkansas, California, Colorado, Florida, Hawaii, Idaho, Illinois, Iowa, Kansas, Louisiana, Maryland, Michigan, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, North Dakota, Ohio, South Dakota, Utah and Wyoming. The largest amount of missing data for any one variable retained in the buprenorphine dataset was 50%. The sample size, after restricting the analyses to these twenty four states, was N=883,207 for 2006 and N=968,237 for 2008. This sample, based on individuals representing 24 states, was then utilized as the basis for MI. The MI sample was N= 4,258,996 for 2006 and N= 4,698,055 for 2008 (the combined study year sample size was too large to perform MI). The next step was to restrict the sample for the LD analyses, or to only those individuals with complete case data. The LD sample was N=240,757 for 2006, N=320,656 for 2008 and N=561,413 for the combined 2006-2008. Similar to the methadone analyses, BA was performed on the LD sample. The buprenorphine BA analyses consisted of three initial unrestricted random samples for each study year, N=241 for 2006, N=257 for 2008 and N=253 for the combined 2006-2008 dataset. Each of these samples was replicated in 100 separate datasets which were then combined to form a final sample. The final BA samples for the buprenorphine analyses were N=24,100 for 2006, N=25,700 for 2008 and N=25,300 for the combined 2006-2008 dataset.

Aim 3

The Aim 3 analyses utilized the primary methadone dataset described in Aim 2; however, the Aim 3 sample was restricted differently. Figure 3.1 provides an overview of the various analytic samples utilized in Aim 3, including the steps that were taken to restrict the sample for each analysis. As shown in Figure 3.1, similar to Aim 2, the initial 1998-2008 combined methadone sample contained 3,721,278 individuals, 1,704,606 from 1998 and 2,016,672 from 2008. The main outcome for Aim 3 was

use of medication assisted treatment, a treatment that is only appropriate for opioid users; therefore, the next step restricted the sample to only those individuals that reported opioids (including heroin, synthetic opioid or non-prescription methadone) as their primary, secondary or tertiary drug of abuse at admission. Once the sample was restricted to opioid users, the 1998 sample was N=327,647 and N=511,448 for 2008.

Thirty-eight states had sufficient data available in both 1998 and 2008 for the outcome of interest and main predictor variables. The 38 states were: Alaska, California, Colorado, Connecticut, Delaware, Florida, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Utah, Vermont, Virginia, Wisconsin and Wyoming. The largest amount of missing data for any one variable included in the sample was 60%. Once the remaining twelve states were excluded from the dataset, the 1998 sample was N=299,452 and the 2008 sample was N=461,004.

The 1998 and 2008 samples of opioid users from 38 states were then used as the basis for MI. The MI sample for 1998 was N=1,497,260 and the 2008 MI sample was N= 2,305,020. The next step was to restrict the 38 state sample for the LD analyses. The LD samples, once all cases with any missing data were removed, were N=8,311 for 1998, N=81,584 for 2008 and N=89,895 for the combined 1998-2008 sample.

Similar to Aim 2, bootstrapping was performed on each year's LD sample. The Aim 3 BA consisted of three unrestricted random samples for each of the study years, N=250 from the 1998 LD dataset, N=246 from the 2008 LD dataset and N=253 from the combined 1998-2008 dataset. Each of these samples was replicated in 100 separate datasets which were then combined to form final BA samples. The final BA samples were N=25,000 for 1998, N=24,600 for 2008 and N=25,300 for the combined 1998-2008 dataset.

Missing Data

As an administrative dataset, the TEDS contains several variables that substance use treatment programs are required to report, as per state law. However, the TEDS also includes supplemental variables that are not mandatory for programs to report, such as treatment wait time, psychiatric problems, health insurance type, veteran status, source of income, marital status, criminal justice referral and payment source. Several of these variables were included in the analyses for Aims 2 and 3, and treatment waiting time was the outcome of interest in Aim 2. Because these variables were optional for programs to report, there was a significant amount of missing data to contend with. This section provides an overview the types of missing data and describes the techniques used to handle missing data in this dissertation.

Types of Missing Data

Several methods have been developed to address missing data. Choosing the most appropriate method requires an understanding of the types of and/or reasons for missing data in order to minimize bias.[144,145] The three main types of missing data are: *missing completely at random* (MCAR), *missing at random* (MAR) and *missing not at random* (MNAR). When data are *MCAR,* there are no distinguishable patterns of variables leading the data to be missing.[146–148] For example, in a randomized controlled trial, data would be MCAR if participants in *both* the treatment and control arms drop out of the study because they had relocated. These data are MCAR because study arm assignment is unrelated to study participation and an individual's relocation. Data that are MCAR are considered "harmless" because they will not bias the mean or standard deviation estimated from the dataset, and will not impact the

estimated relationships among other variables in the dataset given the fact that missingness occurs because of random events.[144,149]

While the extent of missing data and the way in which missing data are handled are not often explained in publications, when missing data are reported, they are most frequently described as *missing at random* (MAR).[150] When data are MAR, the probability that the data are missing is based on observable characteristics within a study population but are not related to the outcome of interest.[147,148] For example, if a larger proportion of Hispanics, as compared with other racial/ethnic groups, are less likely to report their income on a survey, their data are considered MAR as long as the Hispanics in the sample include sufficient representation of Hispanics in all income strata. In other words, the missing data are conditional on being Hispanic but not on the dependent variable of income. Therefore, when data that are MAR take into account the variable on which they are conditional (such as including the conditional variable in a regression equation), bias can be minimized.[151]

Despite the fact that researchers usually report missing data as MAR, some researchers argue that missing data are usually *missing not at random (MNAR).*[150] Data that are MNAR occur when the probability that an item is missing is dependent upon unobserved information among a subset of participants.[147,148] Utilizing the previous income example, data would be considered MNAR if low income Hispanics were less likely to report their income on a questionnaire. In this case, the reason for missingness is a characteristic of the outcome of interest and is therefore not a random event. This is particularly problematic because any estimates produced from such a sample will be biased, in this case producing an inflated overall income for the sample due to fewer responses among lower income Hispanics.[144] Data that are MNAR weaken the generalizability of the findings because the pattern of the missing data is systematic and therefore the associations are not likely to represent the general population.

Missing Data Methods

This dissertation employed two techniques to address missing data: Listwise Deletion and Multiple Imputation. The following section provides an overview of each technique, as well as a discussion of other methods used to handle missing data.

Listwise Deletion (LD)

The most common method for analyzing missing data is listwise deletion, or excluding cases from analysis if any item within that case is missing. The underlying assumption of listwise deletion is that the data are MCAR; therefore, utilizing listwise deletion with data that are MCAR would not introduce bias because the data that are deleted do not have a systematic pattern of missingness.[152] However, when listwise deletion is applied to data that are MAR or MNAR, bias is likely to be introduced due to a potential overestimation of the certainty of the results. [153] For instance, if a sample of Americans were asked about their annual household income, and low income participants were less likely to report their income, the resulting mean income would be larger than the true mean income had the lower income individuals responded to that question. The standard error would be smaller than is accurate because the assumption is that the sample was randomly selected. However, when data are MAR or MNAR, and are excluded via listwise deletion, the retained sample no longer reflects a random sample of the population and therefore selection bias may be introduced. Some researchers, however, argue that utilizing listwise deletion with data that are MAR, particularly when the missing data for predictor variables are independent of the dependent variable, will yield unbiased results because it is similar to stratified sampling.[154]

A general drawback of listwise deletion, regardless of the type of missing data, is the impact that listwise deletion can have on statistical power. Because listwise deletion removes all cases from the dataset that have any missing data, this method poses a threat to external validity, particularly in studies

with small sample sizes. However, in large sample surveys, such as the TEDS-A, particularly when data are MCAR, listwise deletion is not likely to impact results due to the large sample size.[144] *Pairwise Deletion*

Pairwise deletion is similar to listwise deletion, in that missing data are excluded from analysis; however, with pairwise deletion, only the missing item is excluded while the rest of the case is retained.[152] The ability to preserve a majority of the items for each case is advantageous because it results in a larger sample size (as compared with listwise deletion), thereby increasing statistical power.

Similar to listwise deletion, utilizing pairwise deletion for data that are MCAR will likely produce unbiased results because of the ability to retain the entire sample minus the missing items. However, when using pairwise deletion for data that are MAR or MNAR, it is difficult to produce accurate estimates of the standard error due to fluctuations in the sample size.[155,156]

For example, when assessing the relationship between several independent variables via a correlation matrix, utilizing a dataset in which pairwise deletion has been performed can be problematic because each correlation may include a different set of cases, making comparisons difficult and potentially prohibiting the use of these correlations in multivariate analyses.[157]

Imputation

As a general category, imputation refers to the act of replacing missing values from a dataset with estimated values. Because imputation allows for the analysis of a complete dataset, threats to external validity may be minimized. There are several imputation methods, but the most widely utilized methods include: mean substitution, hot deck imputation, regression imputation, and multiple imputation. This section reviews each method, with a more in-depth description of MI, the imputation method used to handle missing data in this dissertation.

Mean Substitution

Mean substitution is the process of substituting a missing value with the mean of non-missing values.[158] Similar to both listwise and pairwise deletion methods, the main assumption underlying mean substitution is that the data are MCAR and normally distributed. When this is the case, substituting the mean for this missing data will likely lead to unbiased results. However, when mean substitution is used with data that are not MAR, it can lead to an under- or over-estimation of the true value of the item because the reason the item is missing may be associated with the outcome. For example, individuals with higher incomes may be less willing to report their income than individuals with lower incomes; therefore, by replacing missing income with the mean income, the result will be an underestimate of the true value of income. Similarly, mean substitution may also weaken variance estimates because by substituting the mean, the true variability of the data are compromised.

Hot Deck Imputation

Hot deck imputation is a useful tool for imputing missing data because this approach uses nonmissing values from characteristically similar respondents, called donors, to impute missing values.[159] This imputation process is carried out through the creation of a matrix of variables that a researcher deems are related to the missing item to be imputed.[160] For example, if occupational status (unemployed, employed, etc.) is missing from a survey, a researcher with in-depth knowledge of the study can identify a set of variables that may be associated with occupational status, such as occupation and annual income. The data then form a *deck* where respondents with complete data on each of these variables are sorted.[161] Then, respondents who match the donee, or the respondent with missing data, then form a donor pool of potential imputes.[152] The donor may be randomly selected from the pool, called random hot deck methods, or the donor may be the "nearest neighbor" meaning that it most closely resembles the missing data characteristics (called deterministic hot deck methods).[162]

Hot deck imputation is widely utilized in the analysis of large surveys conducted by organizations such as the United States Census Bureau and the Substance Abuse and Mental Health Services Administration. National surveys with large sample sizes are most appropriate for hot deck procedures because of the increased likelihood of finding a similar donor due to the large sample size. Hot deck imputation is not as useful when it is applied to data sets with large amounts of missing data, or when used in the analysis of data sets with a small sample size. In these cases, the validity of hot deck imputation is threatened due to the need to identify matching donors for several respondents (in datasets with large amounts of missing data), or the need to find matching donors with a limited number of respondents (in small datasets that may yield few donors).[158,163–165] Finally, in order to accurately identify similar donors in the hot deck procedure, researchers must be able to determine a set of variables that are predictive of the missing data. The hot deck procedure hinges on this identification, yet it is subjective, and as such introduces the potential for bias.

Regression Based Single Imputation

Similar to hot deck imputation, single regression imputation draws on what is known about cases with missing data, as well as cases with non-missing data, and uses this information to predict a missing value via a regression equation.[166] Using the same example as above, if we wanted to impute missing values for occupational status, we would first calculate the correlation between variables that we think might be associated with occupational status, such as annual income, occupation and several others, and those variables with the highest correlations would then be used as predictors in a regression equation in which employment status was the outcome variable. Then, all of the variables (with complete data) that were associated with the outcome are used to predict the missing values for employment status.[150]

Single regression imputation affords researchers the ability to "recover" missing data through estimates, a benefit that can increase statistical power and generalizability of the findings. Additionally, the ability to include random error in the regression equation helps to account for the uncertainty of the imputation procedure. Despite these advantages, there are also some noted drawbacks. In particular, similar to hot deck imputation, special attention must be paid to the variables chosen as predictors for the imputation. If there is multicollinearity among these variables, the variance of the missing data variable may be artificially high.[146] Finally, single regression imputation assumes a linear relationship between variables; however, when this is not the case, the model may produce artificially low significance values, leading to a falsely conclusion of statistical significance.

Multiple Imputation (MI)

Multiple imputation (MI) is similar to hot deck and single regression imputation, in that this procedure also utilizes existing data to help inform imputed values. However, with MI, the process of creating imputed values for missing data is carried out several times.[167] More specifically, similar to single regression imputation, a predictive statistical model is developed based on a set of independent variables that are correlated with the missing variable, an error term is added and then an imputed value is computed.[168] This process is then repeated, usually between five and ten times, resulting in the creation of five to ten complete data sets. Once these data sets are created, analyses can then be performed (analyses are run separately on each dataset), and the results are then pooled in order to create a single set of statistics, including parameter estimates and standard errors.

The main advantage of MI is that through these multiple steps in the procedure, and the inclusion of an error term at each step, the uncertainty inherent in imputation is accounted for because the variability of the data is considered. The ability to account for the fluctuations in standard error across

each imputed data set can help reduce type I error, or the wrongful conclusion that there is an effect when none is present.[152]

The creation of several distinct data sets in the MI procedure is a critical strength to this technique. Because each data set is generated randomly, the potentially imputed values may vary slightly from one another. The randomness and repeated process of MI help to increase the likelihood of making valid inferences based on these imputed data by increasing the random variability that is inherent in nonimputed data.[168]

MI has been used to impute missing data in research on sensitive topics, such as substance use and sexually transmitted infection status. For example, MI was used in a study investigating the factors associated with severe liver disease among HCV-infected PWIDs.[169] The predictive model contained 8 variables, 6 of which had varying amounts of missing data. Researchers used both listwise deletion and MI to determine which of the eight factors were associated with severe liver disease. When comparing the two methods, listwise deletion found that male sex, age over 40, HCV infection of 18 years or more, excessive alcohol consumption and HCV genotype 3 were all associated with severe liver disease. The MI-enhanced model found the same five variables to be associated with severe liver disease, as well as the addition of HIV infection. Though the findings from the listwise deletion model are similar to the MIenhanced model, the increase in power provided by MI allowed for additional associations, affirming the current evidence base regarding the role of HIV co-infection in advancing liver disease, [170–173]

MI and listwise deletion methods were also utilized in a study predicting factors associated with Chlamydia infection among teenage and young adult men.[174] Laboratory data confirming Chlamydia status were missing for 28% of the young adult sample and 18% of the teenage sample. Researchers first assessed whether missing data were due to a nonresponse bias and determined that males in both samples with missing Chlamydia status were not significantly different than males with complete data. Researchers then imputed missing Chlamydia status for both samples utilizing MI and compared the

results to those achieved through listwise deletion. There was little difference in the findings between the missing data methods so the researchers chose to report the listwise deletion model results in their paper. This study demonstrates that in certain circumstances, such as datasets with large sample sizes and when there is a lack of association between the missing data and the outcome of interest, listwise deletion can be as effective as multiple imputation.[144]

A main drawback of MI is the accurate specification of predictor variables.[168,175] Researchers using MI must have a distinct sense of the variables that predict missingness because these variables must be included in the imputation model in order to reduce bias and potentially invalid conclusions. For example, Hippisley-Cox developed an algorithm to predict cardiovascular risk among UK residents and, after using MI to account for missing data, found that cholesterol was not associated with cardiovascular risk.[176] This finding drew a fair amount of criticism given that it defied conventional wisdom about cardiovascular risk.[177–179] Due to these criticisms, the authors re-ran their analyses using listwise deletion, and found a strong association between cholesterol and cardiovascular risk.[180] The authors then developed new MI models that included additional predictor variables that might help to inform the missing values. When the revised MI-enhanced dataset was used to run the cardiovascular risk model, the researchers found an association between cholesterol and cardiovascular risk. Given this, the authors concluded that they had not used a sufficient number of independent variables in the initial MI model to accurately predict the imputed values, which then led to an underestimation of the association between cholesterol and cardiovascular risk.[180]

To explore missingness in this dissertation, cases that contained missing data were compared to those without missing data on all variables of interest in this study. The results of these comparisons indicate that for both Aims 2 and 3, the two samples were significantly different on nearly every study variable, indicating that the data are not likely MCAR.

Because this dissertation utilized very large datasets, concerns regarding a reduction in sample size when considering missing data methods were minimized. For this reason, and the fact that retaining the same sample size across analyses was preferable, LD was chosen as one method for handling missing data in this dissertation. However, given the large amount of missing data in both of the Aim 2 and 3 datasets, MI was also chosen so that complete case analyses could be performed, and any bias associated with excluding cases with missing data would be reduced. Both methods were performed for each Aim and study year and the findings across these methods were compared for the main outcomes in Aims 2 and 3. Due to the very large dataset for the combined year analyses, only LD was carried out.

Listwise Deletion was carried out by eliminating all cases from each dataset that contained at least one missing value. A dummy variable indicating missing data in any one of the variables of interest was created and the sample was then restricted based on those cases in which there were no missing data. Multiple imputation was performed using the ProcMI function and Markov Chain Monte Carlo method in SAS 9.3 (SAS Institute, Cary, NC). While there is some disagreement in the literature regarding the inclusion of outcome variables in MI procedures[181–183], the dependent variable was included in all MI procedures. All study variables, including the dependent variables, were included in the imputation models. Each single year dataset in Aims 2 and 3 were imputed five times. Regression analyses were then performed on each dataset and the results were pooled using the ProcMIAnalyze function.

Validating Findings Derived from Large Samples

The final samples used in the analyses for Aims 2 and 3 were very large, even after restricting them by study criteria and to those individuals with complete data. An important issue to consider when analyzing large datasets such as these is that the increased power due to the large size of the sample can result in an increase in the amount of significant associations.[184] These associations, while statistically significant, may have very small effect sizes, reducing the utility of the p-value as the sole basis for

interpreting study findings.[185] One way to address this limitation is to present the effect sizes and confidence intervals along with the p-value so that readers have a better understanding of the extent of the relationship between variables.[184] Another way to address this concern is to utilize a validation procedure to augment significance testing.[143] The most commonly used validation procedures are bootstrapping and jackknifing. The bootstrap and jackknife procedures are resampling techniques that can be used with non-normally distributed data to estimate parameters, standard errors and confidence intervals. These techniques are particularly useful when there is uncertainty regarding the generalizability of study findings. The following section provides a brief overview of each method.

Jackknife

As a resampling procedure, the jackknife technique, also known as the "leave one out" procedure, utilizes an entire sample, without replacement, to estimate a given parameter.[186] To do this, a single case is eliminated from the original sample one step at a time, and a "pseudo-value" is computed to estimate the parameter of interest at each step.[185] This procedure is repeated over a specified number of times as each observation is dropped from the sample. Once the iterative estimate process is complete, the "pseudo-values" are averaged to create an overall estimate of the parameter of interest.[187]

In addition to parameter estimates, the jackknife procedure can be used to create confidence intervals and estimate standard errors. Because observations or cases are removed from the original dataset one at a time, the jackknife procedure is particular sensitive to outliers and can reduce bias given the ability to detect these observations.[185]

Bootstrap

Similar to the jackknife procedure, bootstrapping involves the creation of a new set of samples via repeated resampling from an original, representative sample. Unlike the jackknife procedure, bootstrapping allows for random sampling with replacement, meaning that each time an observation is selected for bootstrapping, it is returned to the original dataset, allowing for it and all other observations to have an equal chance of being drawn at each selection step.[188] This procedure is repeated until a set number of cases is achieved for a set number of samples. The target sample size is determined prior to the start of the procedure and usually equals the size of the main sample, unless bootstrap subsampling is performed, in which case a fraction of the original sample is selected.[189] Bootstrap subsampling is often utilized with large datasets and when traditional bootstrapping procedures fail. The number of replications, or the number of times a new sample is created, is also determined a priori and usually ranges from 100-1000, or more.[143,190] Similar to MI, the bootstrap samples are pooled, which creates a sampling distribution and facilitates the computation of parameter estimates, standard errors and confidence intervals.[191]

Bootstrapping has been found to provide more stable estimates than the jackknife procedure.[143,186,192] While the jackknife procedure is particularly effective at reducing bias through the identification of outliers, bootstrapping can provide more comprehensive and accurate estimates for a given sample or set of samples. In Aims 2 and 3 of this dissertation bootstrapping was utilized as a validation technique to ensure that model results were consistent when performed on smaller and different samples.

Chapter 4: Conceptual Framework

The first aim of this study is guided by a theoretical framework developed by Schneider and Jacoby that sought to explicate the impact of external influences on bureaucratic policy making.[193] The findings from this analysis provided a theoretical foundation for the selection of state-level factors utilized in the development of models for Aims 2 and 3 of this study.

Medicaid is a combined federal/state program, with the federal government and state governments sharing the costs of Medicaid services, depending upon the per capita income of the state, among other factors.[128] The federal government issues guidelines on "mandatory services" that states must cover, such as inpatient hospital stays, physician visits, as well as several other services; however, states can choose whether to cover "optional services", which include prescription drugs and dental services, among other services.[194] The decision regarding what optional services state Medicaid programs will cover ultimately lies with state Medicaid administrators. Given the magnitude of this decision and the variability in coverage across states, Schneider and Jacoby sought to understand the factors that influence the number of optional services covered by states. To do this, Schneider and Jacoby developed and tested a theory that posited four levels of influence on Medicaid policy making: elected officials, interest groups, structural influences and state-level environmental conditions.[193] Schneider and Jacoby believed that elected officials have the potential to influence Medicaid decision-making due to the fact that governors and/or legislatures are responsible for appointing state Medicaid directors. [195] Because of this, Schneider and Jacoby tested the influence of two variables at the elected officials' level that have been found to be influential in other relevant research: legislative partisanship, which they defined as the percent of Democrats in both the Senate and the House of Representatives or Assembly; and, the incumbent governor's party affiliation.

At the interest group level, Schneider and Jacoby included four variables to assess the influence of interest groups on the inclusion of Medicaid optional services: the proportion of physicians, dentists, hospital beds and nursing home beds within a state. These variables were chosen because they represented a wide cross-section of parties that might be interested in and lobby for specific optional services.

Structural influences, Schneider and Jacoby posited, may also play a significant role in influencing decisions regarding the coverage of Medicaid optional services. They operationalized these

structural influences through the inclusion of the previous year's Medicaid expenditures, given that these expenses may impact decisions about future spending. Additionally, they believed the FMAP rate may also influence the extent to which states include optional services given that it is an indication of the payment contribution of the federal government. The final structural influence included in their model was whether Medicaid programs are controlled by state or local administrations. In some states, decision making regarding Medicaid lies solely at the state level, whereas in other states, Medicaid decision making has devolved to county officials as well. Schneider and Jacoby hypothesized that in states with local administration involved in the decision making, bureaucrats may have a better handle on the needs of their communities and therefore be more likely to include optional services that reflect the need of the population.

The final group of potential influences in their model was environmental factors. These factors were chosen to account for the conditions within a state that may influence Medicaid directors' decision making, including need, economics and ideology. Schneider and Jacoby operationalized need through the use of state infant mortality rate as an indicator of the overall health of the population. Per capita income was chosen to reflect the economic condition of the state, and the ideological leaning of the state was operationalized through the use of survey data measuring the extent to which state residents lean conservative or liberal.

Schneider and Jacoby assessed the strength of their framework by testing the extent to which the aforementioned independent variables explained the variability across states regarding the total number of optional services adopted. Schneider and Jacoby found that per capita state income, FMAP rate, the proportion of physicians and dentists, state versus local Medicaid administrators and infant mortality rate were all significant factors that influenced the adoption of Medicaid optional services across states.[193]

Schneider and Jacoby were interested in understanding the influences on the volume of optional services states covered; however, this study is focused on the influences for two specific optional services, methadone and buprenorphine treatment. While some forms of substance use treatment are considered mandatory under federal Medicaid guidelines, such as inpatient detoxification, methadone and buprenorphine are optional. Given the fact that methadone and buprenorphine are the two most effective treatments for opioid dependence, it is unclear why only a portion of states provide coverage for these treatments.

Due to limitations on the availability of relevant factors, this study utilizes an adapted version of Schneider and Jacoby's framework to test the correlation of two levels of influence on Medicaid restrictions of methadone and buprenorphine coverage: economic and need. Economic factors will be operationalized through the use of the following state-level variables: FMAP rate, percent of residents receiving Medicaid, per capita income, annual state expenditures and the amount of federal block grant funding for substance use treatment. Finally, need factors will be operationalized through the following state-level indicator: the number of substance use treatment facilities in each state and the number of opioid dependent individuals in each state.

Chapter 5: State-level Analysis of Economic and Need Factors and Medicaid Coverage of Methadone and Buprenorphine Treatment in the United States (Aim 1 Analysis)

Background

Opioid Dependence

Substance use treatment admissions for opioid dependence have increased 71% between 1998 and 2012, due to a large increase in the nonmedical use of prescription opioids and heroin.[1,126,196] By 2013, 4.5 million Americans reported nonmedical use of prescription opioids within the previous month and close to 300,000 people reported heroin use within the previous month.[16] Both nonmedical prescription

opioid use and heroin use have been associated with dramatic increases in the number of fatal drug overdose deaths in the United States. Between 2001 and 2013, fatal drug overdoses that were that result of nonmedical use of prescription opioids tripled and those associated with heroin increased by fivefold.[197]

Expanding access to evidence based treatments for opioid dependence, particularly methadone and buprenorphine, is a critical step in stemming the growing tide of opioid dependence and the negative health consequences associated with it.[198] While methadone and buprenorphine are considered to be the most effective forms of treatment for opioid dependence, public and private insurance programs are not required to cover these treatments. This study examines the association between two sets of factors, economic and need, and state Medicaid coverage or methadone and buprenorphine.

Medicaid Coverage of Methadone and Buprenorphine

Medicaid is a combined federal/state program that provides health insurance for low-income individuals and families. The federal government offers guidelines to states regarding the extent to which medical services and medications should be covered under Medicaid. Ultimately, however, each state develops their own eligibility requirements, as well as coverage parameters for medical care and medications.[124] As a result of state autonomy, there is substantial variability in substance use treatment coverage across states, particularly for methadone and buprenorphine. In some states, for example, Medicaid covers either buprenorphine or methadone; however, in other states, Medicaid covers both medications as long as they are provided in specific settings or after physicians have obtained preapproval. As of 2008, 19 states had some form of restriction on the coverage of buprenorphine and/or methadone.[9]

In 2014, substance use treatment became an Essential Health Benefit (EHB) under the Patient Protection and Affordable Care Act (PPACA). An EHB is a required set of health care services that every insurance plan sold in the Health Insurance Marketplace must cover. Additionally, new Medicaid beneficiaries now covered in states that have opted to expand their Medicaid programs will be entitled to receive substance use treatment as part of their essential benefits. This new EHB status provides significant hope for increased access to substance use treatment services; however, these changes are not likely to decrease the variability in Medicaid coverage of methadone and buprenorphine. State Medicaid programs will continue to have great latitude in choosing the types of substance use treatment services that will be covered. Additionally, while Medicaid expansion has the potential to increase access to substance use treatment, the expansion in services in some states will only apply to new Medicaid beneficiaries and not those that were receiving Medicaid prior to January 1, 2014.[199,200] This study sought to gain a better understanding of Medicaid coverage variability for methadone and buprenorphine in the United States, focusing on two main categories of predictors: the need for treatment and the economic environment of the state. To guide the selection of relevant independent variables, we utilized an adapted framework from a study investigating factors associated with state coverage of Medicaid optional services.[193]

Methods

An historical analysis of publicly available data was conducted using a variety of sources. An explanation of study variables and sources follow.

Independent Variables

The independent variables chosen as economic predictors in this study include: state Federal Medical Assistance Percentages (FMAP) rate, percent of residents in each state receiving Medicaid, per capita income of each state, state expenditures and the amount of substance abuse block grant funding.

The need predictor variables used in this study include: the rate of people seeking opioid treatment in each state and the rate of methadone and buprenorphine programs in each state. Each variable was examined separately to determine whether it was correlated with state Medicaid coverage of methadone in 1998, 2008 and 1998-2008 combined, and Medicaid coverage of buprenorphine in 2006, 2008 and 2006-2008 combined.

Federal Medical Assistance Percentages (FMAP)

The Federal Medical Assistance Percentage is the proportion of funds that the federal government contributes to each state's Medicaid program. The FMAP rate varies by state, however, the average FMAP rate is 57%, meaning that the federal government pays 57% of Medicaid costs. While the FMAP rate is never lower than 50%, in 2013 it was over 70% for Arkansas, the District of Columbia, Idaho, Kentucky, Mississippi, South Carolina and West Virginia.[129] FMAP rates for this study were obtained for fiscal years 1998, 2006 and 2008 from the Department of Health and Human Services.[130]

Residents receiving Medicaid

Data regarding Medicaid beneficiaries were obtained from the Centers for Medicaid and Medicare (CMS), Medicaid Statistical Information System. The total number of beneficiaries was obtained for each state and then the proportion of residents receiving Medicaid was calculated using population totals obtained from the United States Census. Data were obtained for 1999 (1998 Medicaid beneficiary data were not available), 2006 and 2008.

State Per Capita Income

Per capita income was obtained from the US Department of Commerce, Bureau of Economic Analysis for 1998, 2006 and 2008, and was based on the total personal income in each state, divided by the total midyear population.

State Expenditures

State expenditure data include expenses paid by states for education, public assistance, Medicaid, corrections, transportation and capital expenses, among other categories. Expenditure data were obtained from the National Association of State Budget Officers for fiscal years 1998, 2006 and 2008.

Substance Abuse Prevention and Treatment Block Grant (SABG) funding

SABG funds provide states with the opportunity to address their substance use prevention and treatment needs in ways that are unique to their communities. The services funded by SABG vary by state, as does the amount each state receives. SABG data were obtained from the Substance Abuse and Mental Health Services Administration for fiscal years 2006 and 2008 (1998 data were not available). Data used for this study was limited to substance use treatment block grant funds, and excluded the total amount awarded for substance use prevention.

Rate of Individuals Seeking Opioid Treatment

The number of individuals seeking opioid treatment in 1998, 2006 and 2008 was obtained from the Treatment Episodes Data Set – Admission (TEDS-A). TEDS-A data include all drug treatment admissions from public and private substance use treatment programs that receive public funding. TEDS-A data are based on encounters in substance use treatment, rather than distinct individuals. For these analyses, TEDS-A data were limited to individuals seeking substance use treatment services with heroin or prescription opioids reported as their primary, secondary or tertiary substance of abuse. In

order to standardize the number of opioid dependent individuals across states, a treatment rate of opioid dependent individuals per 10,000 population was calculated based on the number of opioid dependent individuals and population of each state.

Rate of Methadone and Buprenorphine Programs

The number of opioid treatment programs were obtained from the Uniform Facility Data Set (UFDS) for 1998, and the National Survey of Substance Abuse Treatment Services (N-SSATS), formerly known as the UFDS, for 2006 and 2008. The UFDS and N-SSATS include all private and publicly funded substance use treatment programs in the United States. The UFDS and N-SSATS data used for this study were limited to the total number of programs providing methadone in 1998 or 2008 and buprenorphine in 2006 and 2008. In order to standardize the number of programs per state, a program rate of programs per one million population was calculated based on the number of methadone and buprenorphine programs (calculated separately) and the population of each state.

Dependent variables

Medicaid Coverage of Methadone and Buprenorphine

State Medicaid coverage of methadone for 1998 and 2008 was obtained from two sources. For 1998, data were obtained from McCarty et al's study, "Methadone Maintenance and State Medicaid Managed Care Programs".[142] For 2008, Medicaid coverage of methadone by state was obtained from the State Financing for Medication Assisted Treatment study.[9]

State Medicaid coverage of buprenorphine in 2006 was gathered from Ducharme at al's study, "State policy influence on the early diffusion of buprenorphine in community treatment programs".[54]

Data for Medicaid coverage of buprenorphine in 2008 were obtained from the State Financing for Medication Assisted Treatment study.

Analytic Approach

Bivariate logistic regression was used to assess the relationship between economic and need factors and Medicaid coverage of methadone in 1998, 2008 and 1998-2008 combined and buprenorphine in 2006, 2008 and 2006-2008 combined. The study timeframe was determined based on the availability of state-level Medicaid coverage of methadone and buprenorphine. The analyses included combined years for each treatment as well as analyses separated by study year in order to determine whether associations between the predictor variables and Medicaid coverage of each treatment remained significant when study years were assessed separately.

Predictor variables were standardized by dividing each mean score by the standard deviation in order to create a common scale. Economic and need factors were then assessed in separate bivariate analyses by predictor variable, year and type of treatment (methadone and buprenorphine). For all study years, Medicaid coverage of methadone and buprenorphine were dichotomized as yes/no. The final sample for each analysis year was confined to only those states with data available for all of the independent and dependent variables in the given year. The analytic samples are depicted in Figure 1.3. All statistical analyses were performed using SAS 9.3 (SAS Institute, Cary, NC). The study was determined exempt by the City University of New York's Human Research Protections Program Office due to the use of publicly available data.

Results

Table 1.1 displays Medicaid coverage by state for methadone in 1998 and 2008 and buprenorphine in 2006 and 2008. In 1998, 25 states provided Medicaid coverage of methadone, as compared with 34

states in 2008. In 2006, 28 states provided coverage of buprenorphine for Medicaid beneficiaries, as compared with 38 states in 2008. A total of eleven states did not cover methadone for Medicaid beneficiaries in either 1998 or 2008 and six states did not cover buprenorphine for Medicaid beneficiaries in either 2006 or 2008. Finally, five states did not cover either methadone or buprenorphine for Medicaid beneficiaries in 2008.

The results of the bivariate logistic regression models for both treatments across study years are presented in Table 1.2.

Economic Factors

State FMAP rate was negatively associated with Medicaid coverage of both methadone and buprenorphine across all study years. In 1998, for every one standard deviation increase (8.34%) in the FMAP rate, the odds of a state providing Medicaid coverage of methadone decreased by 64%. Comparable negative relationships were noted across all study years for methadone. Similarly, in 2006, for every one standard deviation increase (7.86%) in the FMAP rate, the odds of a state providing Medicaid coverage of buprenorphine decreased by 62%.

Per capita income was also significantly associated with Medicaid coverage of methadone and buprenorphine across all study periods. In 1998, the odds of a state providing Medicaid coverage of methadone increased by a factor of two for every one standard deviation ($3,623) increase in per capita income, and in 2006, for every one standard deviation increase ($5,261) in per capita income, the odds of a state providing coverage of buprenorphine more than doubled (OR=2.11).

The association between annual state expenditures and methadone and buprenorphine was inconsistent across study time periods for both methadone and buprenorphine. While state expenditures were associated with Medicaid coverage of methadone in 1998 (p=0.016) and in 19982008 (p=0.001), the relationship was not significant in 2008. For buprenorphine, annual state expenditures were associated with buprenorphine coverage in the combined 2006-2008 analysis

(P=0.048), but not in 2006 or 2008.

The relationship between Substance Abuse Block Grant funding (SABG) and Medicaid coverage of methadone and buprenorphine was assessed for 2006 and 2008 (1998 data were not available) but was not found to be significant in any of the analyses. Finally, the percent of residents receiving Medicaid was not associated with Medicaid coverage of methadone or buprenorphine in any study time period.

Need Factors

The rate of individuals in opioid treatment was only associated Medicaid coverage of methadone in the 1998-2008 analysis. This finding suggests that for every 18 additional individuals/10,000 population being treated for opioid dependence, a state was 9.68 times more likely to cover methadone treatment for Medicaid beneficiaries.

Finally, the rate of methadone programs per one million population and Medicaid coverage of methadone were significantly associated in all three time periods (no associations were observed for buprenorphine). In 1998, for example, for every 2 additional methadone programs per one million people in the population, a state was six times more likely to cover methadone treatment for Medicaid beneficiaries.

Discussion

The main finding of this study is the significant associations observed between two measures of state wealth, FMAP rate and per capita income, and Medicaid coverage of methadone and buprenorphine. A negative relationship between FMAP rate and Medicaid coverage of methadone and buprenorphine was noted across all study time periods, demonstrating that states with greater financial need were less likely to provide Medicaid coverage of methadone and buprenorphine. Similarly, a positive association was found between per capita income across all study time periods, demonstrating

that states with greater financial resources were more likely to cover methadone treatment than states with less financial resources.

The associations between annual state expenditures and Medicaid coverage of methadone and buprenorphine are difficult to interpret given their lack of consistency across study years and treatment type; however, the lack of association found for both percent of residents receiving Medicaid and the total amount of funding received from SABG have an interesting commonality. These two measures are both very specific; one regarding Medicaid itself and the other regarding substance use funding. Unlike per capita income and annual state expenditures, which are measures that include input from all members and sectors of the state, and the FMAP rate which is calculated in part based on per capita income, the percent of Medicaid recipients is not a broad based measure of a state's economy, but rather an economic indicator of a portion of a state's economy. As such, the percent of residents receiving Medicaid may not have a significant impact on the overall financial standing of the state. For instance, it is feasible for a state to have a large disparity in the wealth of its residents, which may result in a moderately large percentage of residents receiving Medicaid, but may not impact the overall economy of the state if there is an equally sizeable segment of the state population with above average wealth. Similarly, the SABG funding proxy measure provides a very narrow measure of the wealth of a state, with its only use being for those programs and services that are specifically related to substance use treatment. Again, such a narrow economic indicator may not be broad enough to impact the overall financial standing of a state. Additionally, if a state receives an above average amount of SABG funding, this may actually serve as marker of a greater need for substance use treatment rather than an indicator of economic need. Given this possibility, future analyses may consider using SABG as an indicator of need rather than as an economic factor.

The findings regarding need factors were inconsistent both within and across treatments. While there was evidence of a significant relationship between the rate of methadone programs and Medicaid

coverage of methadone, the confidence intervals associated with these odds ratios were large. Similarly, the confidence intervals regarding the rate of individuals in treatment for opioid dependence and Medicaid coverage of methadone, which may indicate that the relationship between these variables is weak. While the need factors and buprenorphine findings are somewhat consistent with those observed in the methadone analyses, the N-SSATS data did not include private physicians that are not affiliated with substance use treatment programs, which undoubtedly impacted the significance of these analyses. It is not known, however, whether these associations would become significant if the dataset were to include private physicians that prescribe buprenorphine. Future research in this area might utilize a dataset that provides a better indicator of the proportion of buprenorphine programs *and* providers.

Each annual analysis conducted in this paper (1998, 2006 and 2008) contained a sample of less than fifty states. The small sample size undoubtedly impacted the strength of the associations because when study years were combined, and therefore the sample size increased, nearly every association increased in significance. This may provide further evidence that a larger sample size could increase the strength of the relationships between each of the economic variables, and reduce the confidence intervals; however, this limitation is in inherent in state-level analyses.

While these analyses are historical, and do not include any time period since the PPACA was enacted, the findings of this study remain significant within the context of PPACA implementation. As mentioned previously, the PPACA has not changed the accessibility of methadone and buprenorphine directly. While substance use treatment has become an essential health benefit under the PPACA, states continue to choose the types of treatments their Medicaid programs will cover. Given this, it is very likely that the variability in Medicaid coverage of substance use treatment services that was observed in this study will persist post-PPACA implementation, resulting in inconsistent access to these evidencebased treatments.

Finally, this study investigated Medicaid coverage of methadone and buprenorphine as a dichotomous outcome. Other studies have investigated the accessibility of these treatments in terms of degrees.[9] For instance, in some states Medicaid coverage of methadone and buprenorphine is unrestricted, while in other states Medicaid programs put limits on the length of time a patient can be covered, require prior authorization for these treatments, and delay reimbursement to practitioners and programs by not putting these treatments on Medicaid formulary lists. Such restrictions are permissible under the PPACA, but may create additional barriers to both the provision and utilization of these treatments. Future research should investigate the extent to which environmental factors within a state are associated with different types of Medicaid restrictions of methadone and buprenorphine, and determine the extent to which these restrictions influence access to methadone and buprenorphine treatment.

Limitations

Data regarding Medicaid coverage of methadone and buprenorphine by state were not available for consecutive years. This limited my ability to detect the direct impact when a policy changed. Given this limitation, particularly for need factors, it is not possible to determine whether Medicaid policy regarding coverage of methadone and buprenorphine led to an increase or decrease in the number of methadone and buprenorphine programs or individuals seeking treatment for opioid dependence. The findings presented in this paper simply indicate that some of the factors examined were associated. Future studies on this topic might investigate Medicaid coverage of methadone and buprenorphine over multiple, consecutive years in order to detect distinct changes in policy that could help to isolate causal factors.

This study utilized data from the TEDS-A, which includes only those individuals enrolled in substance use treatment, to investigate the association between the need for treatment and Medicaid coverage of these treatments. The number of people enrolled in treatment was used as one proxy measure for need, but the associations observed were weak. A better proxy measure for future research might include the rate of opioid dependence derived from a population-based sample so that individuals in and out of substance use treatment can be captured.

The majority of privately owned treatment facilities, which according to SAMHSA account for approximately twenty-nine percent of outpatient methadone programs in the United States, are not included in the TEDS data.[201] Additionally, individuals treated through private physicians that are not contained within a substance use treatment facility are not included in TEDS.[202] The exclusion of treatment programs not receiving public funds and private physicians may provide an underrepresentation of the rate of methadone and/or buprenorphine programs and therefore bias the results towards the null.

Conclusion

Although methadone and buprenorphine are the two most effective treatments for opioid dependence, their use in the United States is limited. Previous research has investigated the influence of health insurance coverage, regulatory issues governing these treatments and physician training, among other factors, as potential reasons for the limited use of these treatments. This study expanded on previous research regarding the role of health insurance coverage by investigating the extent to which the economic condition of states and the significance of opioid dependence in states was associated with differences in Medicaid coverage of methadone and buprenorphine. This study provides evidence that states with increased wealth are more likely to provide Medicaid coverage of methadone and buprenorphine than states with less overall wealth. While the findings regarding the need for treatment

were inconsistent, future research should investigate these associations utilizing additional variables that may serve as better proxy measures for the significance of opioid dependence in a state.

Finally, given the sustained increase in opioid use and associated mortality in the United States over the last decade, it is critical to ensure that evidence based treatments are accessible to all individuals in need. While passage of the PPACA and the inclusion of substance use treatment as an EHB provide hope for the expansion and increased accessibility of substance use treatment, states will continue to have the authority to choose the types of treatments covered under their Medicaid programs. Identifying the factors that are associated with states that cover these treatments, and those that do not, is an important step toward increasing the accessibility of these evidence based treatments.

Chapter 6: Medicaid Coverage of Methadone and Buprenorphine and Waiting Time to Enter Substance Use Treatment (Aim 2 Analysis)

Background

Opioid use has increased significantly over the last decade.[3,203] As of 2013, an estimated 2.4 million people were considered to be dependent on opioids; however, according to current estimates, only 2025% of opioid dependent individuals receive some form of treatment.[204] Untreated opioid dependence is associated with significant health consequences, including HIV and hepatitis C infection, drug overdose, injection drug use, and unsafe sex and drug behaviors.[24–31] Medication assisted treatments (MAT), such as methadone and buprenorphine, are the most effective form of treatment for opioid dependence.[4,5,47,48] MAT have been associated with reductions in HIV infection, mortality, crime, injection drug use, heroin use, and syringe sharing.[38–40,43,205,206] In order to address the epidemic of opioid use and reduce the public health consequences associated with it, experts have called for an increase in access to MAT.[198]

Substance use treatment that is readily accessible can have a significant impact on both engagement and retention in treatment. When individuals are required to wait to enter treatment, they are at increased risk for treatment dropout,[104] mortality,[106] arrest,[107] untreated psychiatric problems,[108] new HIV infection,[109] and a return to or initiation in injection drug use (IDU).[110] Further, an inverse relationship between the time a person waits to enter treatment and treatment entry has been observed in several studies, such that the longer a person waits to enter treatment, the less likely they are to enroll in it.[92,95,111–113] Research suggests that the first twenty four hours following a client's initial contact with a substance use treatment program is the most critical period as it results in the largest decrease in program enrollment.[92]

Factors Associated with Treatment Wait Time

Treatment wait time, which is defined here as the lag between when a person attempts to enter substance use treatment and actual treatment entry, is frequently cited as a primary barrier to initiating substance use treatment.[90–93] Factors contributing to treatment wait time may be the result of delays related to individuals, organizations or structural factors. Individual-level factors such as unemployment[96], homelessness[96], being African American[103,116], cocaine use[103,106], lack of insurance[94] and psychiatric problems[103] have all been associated with longer wait times for treatment entry. The associations between age[96,106,117] and gender [100,102,105] and treatment wait time have been inconsistent.

While individual-level factors may contribute to delays in treatment entry, they are not believed to have a significant impact on treatment wait time.[90,98] Rather, organizational factors, particularly regarding program inefficiencies, are believed to contribute most significantly to wait times.[118–121] Specific organizational factors associated with delays to treatment entry include larger client caseload[96,123], staff shortages,[92] provision of methadone[116], inefficient phone scheduling systems[99], central intake units[94] and increased proportion of clients receiving public assistance[123]; whereas forprofit

programs[117], programs with an increased number of patients attending daily[96] and programs with performance contracting[101], or financial incentives for improvement in patient outcomes or organizational efficiencies, have been associated with reduced treatment wait times.

There is scant literature regarding the influence of structural factors on treatment wait time. The only study that we found was an investigation of systems-level and individual-level characteristics by Carr et al.[96] This study found that bureaucratic delays related to processing court-ordered treatment resulted in increased wait times for substance use treatment entry.[37]

The main purpose of this study is to investigate the association between state Medicaid coverage of methadone and buprenorphine and the length of time individuals wait to enter substance use treatment. This study includes individual-level demographic variables and program-level characteristics that have been observed in the literature. In addition, this study explores the contribution of several other structural factors in addition to Medicaid coverage of methadone and buprenorphine. Utilizing an adapted framework from a study investigating the factors associated with state coverage of Medicaid optional services, this study includes structural factors related to the economic environment and the need for treatment within states.[193] These variables include the percent of residents receiving Medicaid in each state, per capita income of each state, the rate of opioid dependent individuals enrolled in substance use treatment and the rate of methadone or buprenorphine programs in each state.

Methods

The primary objective of this study is to provide an individual-level investigation of the association between Medicaid coverage of methadone and buprenorphine and treatment wait times. We hypothesize that individuals enrolled in substance use treatment programs in states with Medicaid coverage of methadone and buprenorphine will experience shorter wait times to enter treatment.

The main predictor of interest in this study is whether the state in which a person sought treatment provided Medicaid coverage for methadone or buprenorphine (examined separately) in 1998 and 2008 for the methadone analysis and 2006 and 2008 for the buprenorphine analysis. Additional independent variables include both individual-level demographic variables, program-level characteristics and structural variables. The structural variables served as state-level fixed effects estimators in order to help account for the unobserved heterogeneity of the state environment when examining the effect of state Medicaid policy. A detailed description of each of these variables is provided below. Finally, the dependent variable is the amount of time an individual waited to enter substance use treatment.

Analytic Sample

Individual level data regarding admission to substance use treatment in 1998, 2006 and 2008 were obtained from the Treatment Episodes Data Set-Admissions (TEDS-A), an administrative data set containing annual admissions of individuals 12 years of age and older to licensed substance use treatment programs in the United States.[126] TEDS-A data are publicly available through the Substance Abuse and Mental Health Data Archive (SAMHDA).[127] The TEDS-A data represent annual encounters in substance use treatment, rather than individual clients, such that if a single individual had multiple episodes in substance use treatment programs in a given year, each treatment episode is counted separately.

Once TEDS-A data were obtained, separate methadone and buprenorphine datasets were created by matching structural variables with the state indicator variable representing the state in which a person sought substance use treatment. State matching was carried out for each study year and then merged into a final dataset for each treatment type containing both study years. The final methadone

dataset contained data for 1998 and 2008 and the final buprenorphine dataset contained 2006 and 2008 data. The unit of analysis in each final dataset was person-year.

A description of the analytic sample is provided in Figure 2A.1. For the methadone analyses, the sample for each study year was restricted to individuals enrolled in any type of substance use treatment in 1998 and 2008 in the following fourteen states for which there were sufficient data available for the outcome of interest, main predictor variables and the combined year analyses: Arizona, Colorado, Florida, Hawaii, Idaho, Iowa, Kansas, Louisiana, Montana, New Hampshire, New Mexico, Ohio, South Carolina and Wyoming.

For the buprenorphine analyses, there were 24 states with sufficient data available for the outcome of interest, main predictor variables and the combined year analyses. The buprenorphine sample included individuals enrolled in any type of substance use treatment in 2006 and 2008 in Arizona, Arkansas, California, Colorado, Florida, Hawaii, Idaho, Illinois, Iowa, Kansas, Louisiana, Maryland, Michigan, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, North Dakota, Ohio, South Dakota, Utah and Wyoming.

Independent Variables

Individual and Program-Level Variables

Individual and program-level variables obtained from the TEDS-A for both the methadone and buprenorphine analyses included sex, age, race, gender, education, marital status, income, unstable housing, drug use, psychiatric problems, treatment type, provider type and insurance coverage.

Structural variables

Structural variables included the percent of residents in each state receiving Medicaid, per capita income of each state, rate of opioid dependent individuals enrolled in substance use treatment,

rate of methadone or buprenorphine programs in each state and state Medicaid coverage of methadone and buprenorphine. Each continuous structural variable (percent of residents in receiving Medicaid, per capita income, rate of opioid dependent individuals enrolled in treatment and the rate of methadone or buprenorphine programs) was standardized by dividing the mean score by the standard deviation in order to create a common scale. A description of each structural variable follows.

Percent of Residents Receiving Medicaid

Data regarding Medicaid beneficiaries were obtained from the Centers for Medicaid and Medicare (CMS), Medicaid Statistical Information System. The total number of beneficiaries was obtained for each state and then the proportion of residents receiving Medicaid was calculated using population totals obtained from the United States Census. Data were obtained for 1999 (1998 Medicaid beneficiary data were not available), 2006 and 2008.

State Per Capita Income

Per capita income was obtained from the US Department of Commerce, Bureau of Economic Analysis for 1998, 2006 and 2008, and was based on the total personal income in each state, divided by the total midyear population.

Rate of Opioid Dependent Individuals Enrolled in Substance Use Treatment

The number of opioid dependent individuals receiving substance use treatment was gathered from the TEDS-A data set for the years 1998, 2006 and 2008. In order to standardize the number of individuals per state, a treatment rate of individuals per 1 million population was calculated based on the number of opioid dependent individuals in any type of substance use treatment each year and the population of each state.

Rate of Methadone and Buprenorphine Programs

The number of opioid treatment programs was obtained from the Uniform Facility Data Set (UFDS) for 1998, and the National Survey of Substance Abuse Treatment Services (N-SSATS), formerly known as the UFDS, for 2006 and 2008. The UFDS and N-SSATS include all private and publicly funded substance use treatment programs in the United States. The UFDS and N-SSATS data used for this study were limited to the total number of programs providing methadone in 1998 or 2008 and buprenorphine in 2006 and 2008. In order to standardize the number of programs per state, a program rate of programs per 10,000 population was calculated based on the number of methadone and buprenorphine programs

(calculated separately) and the population of each state.

Medicaid Coverage of Methadone and Buprenorphine

State Medicaid coverage of methadone for 1998 and 2008 was obtained from two sources. For 1998, data were obtained from McCarty et al's study, "Methadone Maintenance and State Medicaid Managed Care Programs".[142] For 2008, Medicaid coverage of methadone by state was obtained from the State Financing for Medication Assisted Treatment study. [9] For both study years, Medicaid coverage of methadone was dichotomized as yes/no.

State Medicaid coverage of buprenorphine in 2006 was gathered from Ducharme at al's study, "State policy influence on the early diffusion of buprenorphine in community treatment programs".[54] Similar to the 2008 data used for methadone, data for Medicaid coverage of buprenorphine in 2008 were obtained from the State Financing for Medication Assisted Treatment study. Finally, similar to methadone, Medicaid coverage of buprenorphine was dichotomized as yes/no for both 2006 and 2008.

Dependent variable

Wait time for entrance into substance use treatment was gathered from TEDS-A for 1998, 2006 and 2008. The TEDS-A defines wait time as the number of days a person waited to enter a treatment facility, based on the time of their initial request for treatment entry and the time that they were admitted to the program. The TEDS-A definition is based solely on delays due to treatment capacity, availability, or requirements due to admission or other programmatic factors. This wait time variable includes only successful admissions to treatment and does not reflect delays that were the result of individual factors, such as unavailability or failure to meet an obligation.

Analytic Approach

Descriptive statistics were calculated to determine the distribution of the outcome variable, treatment wait time. Univariate analysis indicated that treatment wait time was heavily skewed towards zero (range=0-996; mean=5.13, median=0, mode=0, variance=608). Poisson Regression (PR), Negative Binomial Regression (NBR) and Zero-Inflated Negative Binomial Regression (ZINBR) were all considered for modeling the relationship between the predictor variables and treatment wait time. Given the overdispersion of the treatment wait time variable, and the fact that PR could lead to false significance when overdispersion is evident, PR was ruled out.[207,208] While ZINBR can be utilized for models with an excess of zeros, it assumes that the zeros come from two sources, sampling (those that occur by randomly) and structural (those that occur through systematic error); thus, the zeros are modeled differently based on these assumptions.[209] The zeros reported for treatment wait time in the TEDS dataset are not believed to be subject to any systematic bias and therefore should not be modeled separately. Given the inappropriateness of both PR and ZINBR for these analyses, and the fact that NBR has more flexibility in handling overdispersion, NBR was selected.

Bivariate NBR was used to assess the unadjusted association between the main predictor of interest, Medicaid coverage of methadone and buprenorphine, and the amount of time individuals waited to enter substance use treatment. Multivariable NBR was then used to model the relationship between the remaining predictor variables and wait time for treatment entry in a stepwise fashion. Models were developed for each treatment type by single study year and combined study years (only the combined year analyses are presented here). An interaction term of Medicaid coverage and time (Medicaid coverage*time) was added to each combined year model to account for the combined effects of these variables on treatment waiting times. To assist with the interpretation of the NBR estimates, □□coefficients in each model were transformed using the formula: $(e^{\square}-1)(100)$ to provide the percent change in the number of days spent waiting to enter treatment, given a one unit difference in the predictor variable.

All statistical analyses were performed using SAS 9.3 (SAS Institute, Cary, NC). Associations were considered statistically significant at the $p<.05$ level. The City University of New York's Human Research Protections Program Office approved this study.

Missing Data

Missing data can be categorized in three ways: missing completely at random (MCAR), missing at random (MAR) and missing not at random (MNAR). When data are MCAR, there are no distinguishable patterns of variables leading the data to be missing; thus, these data will not bias the estimated relationships given the fact that missingness occurs because of random events.[144,146–149] When data are MAR, the probability that the data are missing is based on observable characteristics within a study population but are not related to the outcome of interest.[147,148] Finally, when data that are MNAR occur when the probability that an item is missing is dependent upon unobserved information among a subset of participants.[147,148]

To explore missingness in this study, cases containing missing data were compared to those without missing data on all variables for each study year. The results of these comparisons revealed that the samples were significantly different on nearly every study variable, indicating that the data are not likely MCAR (Tables 2A.1, 2A.2, 2B.1 and 2B.2). While there is no test to determine whether data are MAR or MNAR, most missing data are treated as MAR.[150] Data in this study were treated as MAR and two missing data techniques were employed prior to analyses: Listwise Deletion (LD) and Multiple Imputation (MI). An a priori cutoff of no more than 55% missing data on any one variable served as the criteria for the inclusion of cases in this study. This criteria was chosen in order to balance geographic representation, sufficient variability in Medicaid coverage of methadone and buprenorphine and the inclusion of relevant covariates.

Listwise Deletion was carried out by eliminating all cases from each dataset that contained at least one missing value for any study variable. A dummy variable indicating missing data for any one of the variables of interest was created and the sample was then restricted based on those cases in which there were no missing data. Multiple imputation was performed using the Markov Chain Monte Carlo method in SAS 9.3 (SAS Institute, Cary, NC). While there is some disagreement regarding the inclusion of outcome variables in MI[181–183], the dependent variable, along with all other study variables, were included in the MI procedures in this study. Each single year dataset was imputed five times. LD and MI were performed for each single study year; however, only LD could be performed in the combined year analyses due to the very large sample size.

Resampling

The samples used for the methadone and buprenorphine analyses were very large, even after restricting by study criteria and to those individuals with complete case data. With such large data sets, the number of significant associations are likely to increase.[184] These associations, while statistically

significant, may have very small effect sizes, reducing the utility of the p-value as the sole basis for interpreting study findings.[185] To address this potential limitation, effect sizes and confidence intervals are presented alongside p-values in each model.[184]

Bootstrapping, a resampling technique used to validate non-normally distributed data, was performed on all LD samples to ensure that model results were consistent when performed on smaller and different samples. Bootstrapping was chosen because it is known to produce stable, unbiased estimates that demonstrate good internal validity, which is critical with large samples. Bootstrapping was employed using an unrestricted random sample of individuals from each single year and combined year LD dataset for each treatment type. Each sample was replicated in 100 separate datasets which were then combined to form a final sample for each study year and treatment.

The final models presented in this paper are from the combined year (1998-2008 for methadone and 2006-2008 for buprenorphine) bootstrapped LD analyses. The reader is referred to Tables 2A.62A.12 for the remaining combined year and single year methadone analyses, and Tables 2B.6-2B.12 for the remaining combined year and single year buprenorphine analyses.

Results

Figures 2A.1 and 2B.1 describe how the final analytic samples for the methadone and buprenorphine analyses were obtained. The demographic characteristics of the final combined 19982008 methadone and 2006-2008 buprenorphine LD bootstrapped samples that are presented in this paper are displayed in Tables 2A.3 and 2B.3, respectively.

Methadone Sample

A total of 26,100 people were included in the methadone sample. The sample was predominantly male (71%), white (73%) and non-Hispanic (88%). Almost two-thirds of the sample

completed high school (63%), one-quarter were married, 40% were employed and 40% were living in an unstable housing situation at the time of treatment entry. The majority of the sample was attending outpatient treatment (64%), 1% were receiving medication assisted treatment and 9% reported some form opioid use at admission. Finally, slightly less than half of the sample (43%) was enrolled in substance use treatment in states that provided Medicaid coverage of methadone. As shown in Table 2A.4, individuals receiving treatment in states with Medicaid coverage of methadone were more likely to be older, male, white, Hispanic, have a high school education, unstably housed, enrolled in a detoxification program, utilizing MAT, using heroin, using one drug at the time of admission, have private insurance, a pension, and seeking treatment in a state with greater per capita income and an increased number of methadone programs per 10,000 population.

Table 2A.5 describes the findings from the unadjusted and adjusted NBR models investigating the association between Medicaid coverage of methadone and the number of days a person waited to enter substance use treatment. Given the large number of significant findings across the models, only the main predictor variable of interest, Medicaid coverage of methadone, and those significant predictors with a percent change of 50% or greater are explored in detail.

Model 1 describes the results of the bivariate association between Medicaid coverage of methadone and the number of days a person waited to enter substance use treatment. This unadjusted association indicated that Medicaid coverage of methadone was associated with an 11% decrease in the number of days that individuals waited to enter treatment ($p=<0.001$).

Model 2 explored the relationship between Medicaid coverage of methadone and treatment wait time with the addition of demographic variables including sex, race, ethnicity, education, marital status, employment, unstable housing and age. Medicaid coverage of methadone was not significant in this model ($p=0.14$); however, both being Hispanic and less than 18 years of age, as compared with being over 45, were associated with treatment wait time. Hispanics experienced a 53% decrease in the

mean number of days they waited to enter treatment, as compared with non-Hispanics (p=<0.0001), and individuals that were less than 18 years of age experienced a 78% increase in the mean number of days they waited to enter treatment, as compared with individuals 45 years of age and over (p=<0.0001). Model 3 included all significant and non-significant variables from Model 2, as well as predictors related to substance use and treatment, including treatment program type, MAT use, psychological problems, the total number and type substances used at the time of treatment admission and whether the person was injecting drugs at the time of admission. The results of Model 3 indicate that, when controlling for demographic and drug-related variables, Medicaid coverage of methadone was negatively associated with treatment wait time, with individuals receiving treatment in states with Medicaid coverage of methadone experiencing a 15% decrease in the number of days they waited to enter treatment, as compared with individuals in states without Medicaid coverage of methadone (p=<0.0001). In addition to Medicaid coverage of methadone, Hispanic ethnicity remained negatively associated with treatment wait time (57% decrease in mean days; p=<0.0001), and being less than 18 years of age, as compared to individuals aged 45 and older, continued to be associated with an increase in treatment wait time (58% increase in mean days; p=<0.0001). Being enrolled in a detoxification program, as compared to a rehabilitation program, was associated with a 88% decrease in the mean number of days a person waited for treatment (p=<0.0001), and individuals receiving MAT experienced a 68% decrease in treatment waiting time, as compared to individuals not using MAT (p=<0.0001). Finally, individuals reporting benzodiazepine use experienced a 60% increase in the mean number of days they waited to enter treatment, as compared with non-benzodiazepine users (p=<0.001). Model 4 contained all of demographic and substance use variables from Models 2 and 3, in addition to health insurance coverage and primary source of income. Similar to Models 2 and 3, Medicaid coverage of methadone was associated with a 16% decrease in the mean number of days individuals waited to enter treatment, as compared to individuals in states without Medicaid coverage of methadone (p=<0.0001).

Hispanic ethnicity (56% decrease; p=<0.0001), enrollment in detoxification, as compared to rehabilitation (89% decrease; p=<0.0001), and MAT use (66% decrease; p=<0.0001), all continued to be associated with a reduction in the mean number of days waiting to enter treatment wait time. Being less than 18 years of age, as compared with individuals 45 and over (61% increase; p=<0.0001), using benzodiazepines (52% increase; p<0.05), having Medicaid, as compared to private insurance (63% increase; p=<0.0001), and having a retirement or pension as the primary source, as compared with a salary (72% increase; p=<0.0001), were all associated with increased wait time. In Model 5, structural variables related to the state environment, including per capita income, rate of methadone programs, rate of opioid dependent individuals in substance use treatment and the percent of Medicaid beneficiaries were added as fixed effects estimators to the demographic, substance use, health insurance and income variables included in Model 4. The addition of these state-level variables resulted in a change in the direction of the association between Medicaid coverage of methadone and treatment wait time. In Model 5, individuals receiving treatment in states with Medicaid coverage of methadone experienced a 90% increase in the mean number of days they waited to enter treatment, as compared with individuals receiving treatment in states without Medicaid coverage of methadone (p=<0.0001). This was the only significant variable in which the direction of the association changed in Model 5. Enrollment in a detoxification program, as compared to rehabilitation (92% decrease, p=<0.0001), and MAT use (67% decrease, p=<0.0001) remained negatively associated with treatment wait times, and reporting zero substances of abuse at treatment entry, as compared to three substances, was also associated with a decrease in treatment wait time (55% decrease, p=<0.0001). Finally, being under the age of 18, as compared to being 45 years of age or older (84% increase, p=<0.0001), and having a retirement or pension, as compared to a salary as the primary source of income (57% increase, p=<0.0001) were all associated with an increase in treatment wait time. In Model 6, time was added to account for differences between 1998 and 2008. In this model, time was associated with an

increase in treatment wait time, with individuals receiving treatment in 2008 experiencing a 239% increase in the mean number of days they waited for treatment, as compared with individuals in 1998 (p=<0.0001). The addition of time also strengthened the association between Medicaid coverage of methadone (123% increase, p=<0.0001), being under 18 years of age, as compared to being over 45 (99% increase, p=<0.0001), enrollment in detoxification, as compared to rehabilitation (92% decrease, p=<0.0001) and having no insurance, as compared to private insurance (60% increase, p=<0.0001) and treatment wait time. The associations between enrollment in MAT (67% decrease, p=<0.0001) and individuals whose primary source of income was retirement or pension, as compared to salary (57% increase, p=<0.0001) remained similar to the associations observed in Model 5.

Model 7 included all of the predictor variables used in Model 6, as well as the addition of an interaction term for Medicaid coverage and time. The interaction term was negatively associated with treatment wait time in this model, suggesting that Medicaid coverage of methadone impacted treatment wait time differently in 1998 than in 2008 (50% decrease, p=<0.0001). The addition of the interaction term to Model 7 increased the association between Medicaid coverage of methadone and treatment wait time, with individuals receiving treatment in states with Medicaid coverage experiencing a 219% increase in the amount of time they waited to enter treatment, as compared with individuals in states without Medicaid coverage of methadone (p=<0.0001). The interaction term also strengthened the association between time and treatment wait time, with individuals in the 2008 sample experiencing a 410% increase in the amount of time they waited to enter treatment, as compared with individuals in 1998 (p=<0.0001). Additionally, being under 18 years of age (92% increase, (p=<0.0001) as compared with individuals 45 and over, having no insurance, as compared to having private insurance (57% increase, p=<0.0001) and having a retirement or pension as your primary source of income, as compared with a salary (55% increase, p=<0.0001), were all associated with increased treatment wait times. Finally, being enrolled in a detoxification program, as compared with rehabilitation (92% decrease,

p=<0.0001), utilizing MAT (67% decrease, p=<0.0001), and reported no substances of abuse at treatment admission, as compared to individuals reporting three substances (51% decrease, p=<0.001), were all associated with reduced treatment wait times.

Buprenorphine Sample

As described in Table 2B.3, a total of 25,300 individuals were included in the buprenorphine sample. The sample was predominantly male (69%), white (66%) and non-Hispanic (89%). Almost two-thirds of the sample (64%) were high school educated and close to one-half (45%) reported an unstable housing situation at the time of treatment enrollment. Outpatient treatment was the most common form of treatment (59%), 5% of the sample was receiving either methadone or buprenorphine, and 20% of the sample reported using some form of opioids at the time of treatment enrollment.

As detailed in 2B.4, individuals who attended treatment programs in states with Medicaid coverage of buprenorphine were more likely to be black, other race, unstably housed, less than 18 years of age and over 34 years of age, be enrolled in an outpatient treatment program, utilize MAT, use heroin, opioids and crack, report two or fewer substances of abuse at the time of treatment admission, be covered by Medicaid, Medicare and private insurance, report public assistance, retirement/pension, other income and salary as their primary source of income, wait longer to enter substance use treatment and seek treatment in states with higher per capita income, an increased number of buprenorphine programs and a higher rate of individuals in substance use treatment.

Table 2B.5 presents the results from the unadjusted and adjusted NBR models investigating the association between Medicaid coverage of buprenorphine and treatment wait time. Similar to the methadone results, only the main predictor variable of interest, Medicaid coverage of buprenorphine, and those significant predictors with a percent change of 50% or greater will be explored in detail.
In the unadjusted analysis presented in Model 1, individuals receiving treatment in states with

Medicaid coverage of buprenorphine experienced a 75% increase in the mean number of days they waited to enter substance use treatment, as compared to individuals in states without Medicaid coverage of buprenorphine (p=<0.001).

Model 2 contained Medicaid coverage of buprenorphine along with the addition of demographic variables, including sex, race, ethnicity, education, marital status, employment, unstable housing and age. Medicaid coverage of buprenorphine continued to be associated with an increase in treatment wait time, as compared to individuals in states without Medicaid coverage of buprenorphine (82% increase, p=<0.001). In addition, being less than 18 (80% increase, p=<0.001), 18-24 (65% increase, p=<0.001) and 25-34 years of age (57% increase, p=<0.001) were all associated with an increase in the mean number of days individuals waited to enter substance use treatment, as compared to individuals over 44 years old. Model 3 contained Medicaid coverage of buprenorphine and demographic variables that were included in Model 2, as well as variables related to substance use and treatment, including treatment program type, MAT use, psychological problems, the total number and type of substances used at the time of treatment admission and whether the person was injecting drugs at the time of admission. Medicaid coverage of buprenorphine remained associated with an increase in treatment wait time (67% increase, p=<0.001). Additionally, attending detoxification programs, as compared with rehabilitation, was associated with a 70% decrease in treatment wait time (p=<0.001).

Model 4 contained all of the demographic and substance use and treatment variables from Models 2 and 3, in addition to health insurance coverage and primary source of income. In Model 4, Medicaid coverage of buprenorphine was associated with a 63% increase in the mean number of days individuals waited to enter treatment, as compared with individuals in states without Medicaid coverage of buprenorphine (p=<0.001). Similar to Model 3, detoxification program enrollment was associated with a 70% decrease in the mean number of days individuals waited to enter treatment, as compared to

rehabilitation programs (p=<0.001). Finally, having Medicare was associated with a 54% increase in treatment wait time (p=<0.001).

Model 5 contained all variables included in the previous models, with the addition of the following state fixed effects estimators: per capita income, rate of buprenorphine programs, rate of opioid dependent individuals in substance use treatment and the percent of Medicaid beneficiaries. The addition of the state-level fixed effects strengthened the association between Medicaid coverage of buprenorphine and treatment wait time, such that individuals receiving treatment in states with Medicaid coverage of buprenorphine experienced a 260% increase in the mean number of days they waited to enter substance use treatment, as compared with individuals in states without Medicaid coverage of buprenorphine (p=<0.001). In addition, the association between use of detoxification programs, as compared to rehabilitation programs, strengthened (82% decrease in wait time, p=<0.001), and the positive association between Medicare coverage and treatment wait time also became stronger (79% increase in wait time, p=<0.001). Finally heroin use was associated with a 67% increase in treatment wait time (p=<0.05).

In Model 6, time was added to the variables used as predictors in Model 5. Unlike the methadone analysis, time was not significant. The association between Medicaid coverage of buprenorphine and wait time remained significant in Model 6, with individuals receiving treatment in states with Medicaid coverage of buprenorphine experiencing a 267% increase in the mean number of days they waited to enter treatment, as compared with individuals in states without Medicaid coverage of buprenorphine. Finally, detoxification, as compared with rehabilitation, remained associated with a reduction in treatment wait time (82% decrease, p=<0.001) and heroin use (67% increase, p=<0.05) and Medicare coverage (79% increase, p=<0.001) were associated with an increase in treatment wait times.

In Model 7, the predictor variables used in Models 1-6 remained and an interaction term for Medicaid coverage and time was added. Unlike the methadone analysis, the interaction term was not

associated with treatment wait time, suggesting that Medicaid coverage of buprenorphine did not have a differential impact on treatment wait time across study years. The addition of the interaction term did, however, increase the association between Medicaid coverage of buprenorphine and treatment wait time. When accounting for the interactive effect of Medicaid coverage of buprenorphine over the two study time periods, individuals receiving treatment in states with Medicaid coverage of buprenorphine experienced a 344% increase in the amount of time they waited to enter treatment, as compared with individuals in states without Medicaid coverage of buprenorphine (p=<0.0001). Finally, similar to Models 5 and 6, detoxification, as compared with rehabilitation, was associated with decreased treatment wait time (82% decrease, p=<0.001), and heroin use (72% increase, p=<0.05) and Medicare (83% increase, p=<0.001) were associated with an increase in the mean number of days individuals waited to enter substance use treatment.

Discussion

This study tested the hypothesis that Medicaid coverage of methadone and buprenorphine would be associated with a reduction in the amount of time individuals waited to enter substance use treatment. The findings from the final models in this study do not support this hypothesis. For both methadone and buprenorphine treatment, state Medicaid coverage was associated with a significant increase in treatment wait time. The study hypothesis was driven by the expectation that Medicaid coverage of methadone and buprenorphine would increase the availability and accessibility of these treatments because more programs would offer these treatments and more individuals would utilize them. As described in Tables 2A.4 and 2B.4, in both the methadone and buprenorphine samples, there was an increased number of methadone and buprenorphine treatment programs per 10,000 population and an increased rate of opioid dependent individuals in substance use treatment in states with

Medicaid coverage of methadone and buprenorphine. While the rate of opioid dependent individuals in each state was accounted for, the wait time variable was calculated for all individuals seeking substance use treatment, regardless of the type of substance of abuse. Limiting this control to *only* those individuals that were opioid dependent in each state might account for this unexpected association, particularly because in the methadone analysis, the direction of the association shifted from a decreased wait time among individuals receiving treatment in states with Medicaid coverage of methadone to an increased wait time when these state-level control variables were added to the model.

Several of the findings from this study are consistent with the literature, including the associations between unemployment[96], unstable housing/homelessness[96], and lack of health insurance[94] and increased treatment wait time. Unlike other studies, this study did not find an increase in treatment wait times for blacks, cocaine users or individuals with psychological problems. Additionally, similar to previous studies in which findings regarding sex were mixed,[100,102,105] males in this study experienced increased wait times in the methadone analysis, but decreased wait times in the buprenorphine analysis. Similar to other studies, our findings regarding age were also inconsistent across the methadone and buprenorphine analyses.[106,117] In the methadone analysis, individuals less than 18 years of age experienced the longest treatment wait time, whereas individuals aged 25-34 experienced the longest wait time in the buprenorphine analysis. Finally, the strongest association found in this study was between time and treatment wait time in the methadone analysis, with individuals enrolled in substance treatment in 2008 waiting 410% longer to enter treatment than individuals enrolled in substance use treatment in 1998.

Limitations

Multiyear data regarding Medicaid coverage of methadone and buprenorphine by state were not available for consecutive years. This limited my ability to detect the direct impact of this policy,

particularly when the policy changed in some states. Given this limitation, it is not possible to determine whether Medicaid policy regarding coverage of methadone and buprenorphine led to an increase or decrease in the number of methadone and buprenorphine programs or individuals seeking treatment for opioid dependence. The findings presented in this paper simply indicate that some of the factors examined were associated.

This study utilized data from TEDS-A, which, for the most part, only includes individuals enrolled in publicly funded substance use treatment programs. The majority of privately owned treatment facilities, which according to SAMHSA accounts for approximately twenty-nine percent of outpatient methadone programs, are not included in the TEDS-A data.[201] Additionally, individuals treated through private physicians that are not contained within a substance use treatment facility, which is the case for the majority of buprenorphine patients, are not included in TEDS-A.[202] The amount of time that individuals in private treatment programs and those being seen by individual doctors waited to enter a treatment program is unknown; therefore, the exclusion of these individuals may result in a skewed representation of treatment wait times for methadone and/or buprenorphine patients overall.

Finally, there was a significant amount of missing data for the outcome of interest in this study. Multiple imputation and listwise deletion were performed on each single year sample; however, only listwise deletion and bootstrapped listwise deletion could be performed on the combined year samples due to the very large sample size. For the 1998 methadone analyses, the association between Medicaid coverage of methadone and treatment wait time differed, with the bootstrapped LD (Table 2A.10) and LD (Table 2A.11) analyses indicating that Medicaid coverage of methadone was associated with a decrease in treatment wait time. The MI analysis (Table 2A.12), however, indicated that Medicaid coverage was significantly associated with an increase in treatment wait time, which was consistent with the findings of the 1998-2008 bootstrapped LD analysis presented in this paper. The 2008 bootstrapped LD (Table 2A.7), LD (Table 2A.8), and MI analyses (Table 2A.9) all indicated that Medicaid coverage of

methadone was significantly associated with an increase in treatment wait time, which is also consistent with the findings presented in this paper, although the effect size in the 2008 MI methadone analysis is smaller than the effect size in the LD and bootstrapped LD analyses. For the single year buprenorphine analyses, the findings are consistent with the direction of the bootstrapped 2006-2008 LD analysis presented in this paper, in that they also indicate that Medicaid coverage of buprenorphine was associated with an increase in treatment wait time. Both single year buprenorphine MI analyses (Tables 2B.9 and 2B.12), however, produced more conservative effect sizes than the single year LD (Tables 2B.8 and 2B.11), single year bootstrapped LD (Tables 2B.7 and 2B.10) and the combined year bootstrapped LD (Table 2B.5) presented in this paper. While these associations were all significant, the variability in the effect sizes across these analyses warrants a cautious interpretation of the extent of the combined year associations presented in this paper.

Conclusion

Overall, the findings of this study highlight significant delays to substance use treatment entry. Individuals in the methadone sample waited an average of five days to enter treatment, and individuals in the buprenorphine sample waited an average of 6 days to enter treatment. In addition, several variables included in these analyses were associated with an even greater increase in average wait time, including Medicaid coverage of methadone and buprenorphine and younger age. Taken together, these findings indicate a significant gap in the demand versus availability of substance use treatment in the US. Further, given the fact that attrition for treatment entry is most significant within the first twenty-four hours after the initial contact is made with a program, these findings may provide insight into the low rate of treatment engagement among substance users in the US.

Chapter 7: Medicaid Coverage of Methadone and Utilization of Medication Assisted Treatment (Aim 3 Analysis)

Background

Between 2002 and 2012, substance use treatment admissions for opioid dependence increased steadily in the United States, from 18% to 26%, while treatment for alcohol, marijuana, cocaine and methamphetamines have either decreased or remained stable.[1] Several types of treatment are currently available for opioid dependence, but they fall into two main categories of modality: drug-free inpatient/outpatient treatment, which includes inpatient rehabilitation programs such as therapeutic communities, and outpatient support groups such as Narcotics Anonymous which are largely focused on abstinence; and medication-assisted treatment (MAT), which includes methadone, buprenorphine and naltrexone. Of these forms of treatment, MAT have been shown to be the most effective at reducing ongoing opioid use by suppressing withdrawal symptoms and blocking the effects for other opioids, such as heroin.[4,5,35,36] This quality is critical in treating opioid dependence because it can both reduce the likelihood of sustained or increased use of other opioids, as well as decrease the likelihood of overdose.

Despite overwhelming evidence supporting the effectiveness of MAT, these treatments are provided by a minority of substance use treatment programs and used by only 10% of opioid dependent individuals.[3,68,210] Further, a recent longitudinal analysis of substance use treatment data indicates that MAT utilization is declining, even in the face of a sustained increase in opioid use and dependence in the United States. Between 2002 and 2012, the use of MAT decreased from 35% to 28%.[1]

Previous research investigating potential explanations for limited uptake and provision of MAT has found individual level factors, such as cocaine injecting or crack smoking[60,61], homelessness[62], recent or previous incarceration[61,62], injection drug use[60–62], previous negative experiences with MAT[63–65], perceived stigma associated with medication assisted treatments, particularly methadone,[65–69] and the

perceived punitive treatment structure of methadone programs,[70] to be associated with a decreased likelihood of MAT utilization. Factors previously found to be associated with an increased likelihood of MAT use include being female,[61,62,71] married[71], having Medicaid coverage[62], use of heroin[60,62,64], older age[61,62] and having previously been in substance use treatment[60,71]. To date, we are unaware of any research investigating the relationship between structural factors such as Medicaid coverage of methadone, and the use of MAT by opioid dependent individuals, which is the primary objective of this study. In addition to Medicaid coverage of methadone, additional structural factors related to the economic environment and the need for substance use treatment within states were included in this study. The selection of these additional structural variables was guided by a framework developed by Schneider and Jacoby to investigate factors related to state coverage of Medicaid optional services. The structural factors utilized in this study include the percent of residents receiving Medicaid in each state, the rate of opioid dependent individuals enrolled in substance use treatment and the rate of methadone programs in each state.[193]

Methods

This study hypothesized that individuals receiving substance use treatment in states with Medicaid coverage of methadone will be more likely to utilize MAT than individuals receiving substance use treatment in states with no Medicaid coverage of methadone. To test this hypothesis, an individual-level analysis was conducted with Medicaid coverage of methadone as the main predictor of interest. Additional predictor variables included a combination of individual-level demographic characteristics, program-level characteristics and structural variables which served as proxies for the state environment. An explanation of the variables and data sources is described below.

Analytic Sample

Individual-level substance use treatment admission data were obtained from the Treatment Episodes Data Set-Admissions (TEDS-A) for the calendar years of 1998 and 2008. The TEDS-A is a publicly available administrative dataset comprised of new admissions to most publicly funded alcohol and substance use treatment facilities in the United States. TEDS-A data are available to the public by the Substance Abuse and Mental Health Services Administration (SAMHSA) and reflect all encounters in publicly funded substance use treatment programs in a given year.[127] The TEDS-A does not include an identifier to distinguish unique individuals; therefore, if the same person enters a treatment program three times in a given year, TEDS-A counts this as three distinct treatment episodes, rather than one.

Once the TEDS-A data were obtained from SAMHSA, they were matched with state-level variables based on an indicator variable representing the state. For instance, if the methadone treatment rate for NJ was 40.5, every individual receiving treatment in NJ would have 40.5 for the methadone treatment rate variable in the final dataset. This matching was done for each study year and the data were then merged into a final dataset that contained both study years. In the final combined dataset, the unit of analysis was person-year.

The analytic sample is described in Figure 3.1. Only opioid users were retained in the final dataset given that the outcome of this analysis is use of medication assisted treatment, and those treatments are only indicated for opioid users. The final sample was restricted to thirty eight states that had sufficient data for both study years on the main predictor variables of interest and the outcome variable. Individuals enrolled in substance use treatment in the following states were included in the final sample: Alaska, California, Colorado, Connecticut, Delaware, Florida, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Utah, Vermont, Virginia, Wisconsin and

Wyoming.

Independent Variables

Individual and Program-Level Variables

Individual and program-level variables such as sex, age, race, ethnicity, gender, education, marital status, employment, income, housing, drug use, program type and insurance coverage were obtained from TEDS-A.

Structural Variables

Structural variables used in this study included the percent of residents in each state receiving Medicaid, the rate of methadone programs in each state, the rate of opioid dependent individuals enrolled in substance use treatment in each state and state Medicaid coverage of methadone. Each continuous variable (percent of residents in receiving Medicaid, rate of opioid dependent individuals enrolled in treatment and the rate of methadone programs) was standardized by dividing the mean score of that variable by the standard deviation in order to create a common scale. A description of each structural variable follows.

Percent of Residents Receiving Medicaid

Data regarding Medicaid beneficiaries were obtained from the Centers for Medicaid and Medicare (CMS), Medicaid Statistical Information System. The total number of beneficiaries was obtained for each state and then the proportion of residents receiving Medicaid was calculated using population totals obtained from the United States Census. Data were obtained for 1999 (1998 Medicaid beneficiary data were not available) and 2008.

Rate of Opioid Dependent Individuals Enrolled in Substance Use Treatment

The number of opioid dependent individuals receiving substance use treatment was gathered from the TEDS-A data set for the years 1998 and 2008. In order to standardize the number of individuals per state, a treatment rate of individuals per 1 million population was calculated based on the number of opioid dependent individuals in any type of substance use treatment each year and the population of each state.

Rate of Methadone Programs

The number of methadone programs was obtained from the Uniform Facility Data Set (UFDS) for 1998, and the National Survey of Substance Abuse Treatment Services (N-SSATS), formerly known as the UFDS, for 2008. The UFDS and N-SSATS include all private and publicly funded substance use treatment programs in the United States. The UFDS and N-SSATS data used for this study were limited to the total number of programs providing methadone in 1998 or 2008. In order to standardize the number of programs per state, a program rate of programs per 10,000 population was calculated based on the number of methadone programs and the population of each state.

Medicaid Coverage of Methadone

State Medicaid coverage of methadone for 1998 and 2008 was obtained from two sources. For 1998, data were obtained from McCarty et al's study, "Methadone Maintenance and State Medicaid Managed Care Programs".[142] For 2008, Medicaid coverage of methadone by state was obtained from the State Financing for Medication Assisted Treatment study.[9] For both study years, Medicaid coverage of methadone was dichotomized as yes/no.

Dependent variable

Data regarding MAT utilization was gathered from TEDS-A for 1998 and 2008. In the TEDS-A, MAT is a category of treatment that includes two types of treatment: methadone and buprenorphine. The

TEDS-A question regarding MAT does not, however, distinguish between these two treatment types. In 1998, the only medication assisted treatment available in the United States was methadone; however, in 2008, buprenorphine was also available as a MAT option. This study utilizes both study years, but only examines the influence of Medicaid coverage of methadone on MAT use.

Analytic Approach

Bivariate logistic regression was used to examine the unadjusted association between Medicaid coverage of methadone and the utilization of MAT. Multivariable logistic regression was then used to model the relationship between all predictor variables and MAT utilization in a stepwise manner. Models were tested for 1998, 2008 and the combined 1998-2008 years. The final combined year model included an interaction term to test for the combined effects of time and Medicaid coverage of methadone on the utilization of MAT.

All associations were considered statistically significant at the $p<.05$ level. Statistical analyses were performed using SAS 9.3 (SAS Institute, Cary, NC). The City University of New York's Human Research Protections Program Office approved this study.

Missing Data

There was a significant amount of missing data in the 1998 and 2008 samples. Missing data can be missing completely at random (MCAR), missing at random (MAR) and missing not at random (MNAR). To explore the patterns of missing data in this study, comparisons were made between observations

containing missing data and those with no missing data on all study variables for 1998 and 2008 (see Tables 3.1 and 3.2). These comparisons indicated that cases with missing data were significantly different from cases with no missing data on nearly every study variable in 1998 and the majority in 2008, indicating that the data were not likely MCAR. Data in this study were treated as MAR and both Listwise Deletion (LD) and Multiple Imputation (MI) were used to handle these missing data. For LD, cases that contained at least one missing value for any study variable were eliminated from analyses. For MI, all study variables, including the outcome variable, were included in the imputation procedure. A series of five imputations was performed using the Markov Chain Monte Carlo method in SAS 9.3 (SAS Institute, Cary, NC). While LD and MI were performed for each single study year; only LD could be performed in the combined year analyses due to the very large sample size.

Resampling

Even after restricting the final dataset based on study criteria, the remaining sample sizes were quite large, raising concern regarding misleading inferences about relatively small effects.[184] Bootstrapping is a resampling technique used to validate non-normally distributed data and produce unbiased estimates that demonstrate good internal validity, which is crucial in large sample sizes.[143] Bootstrapping was performed on the single year and combined year LD samples to ensure that study findings were consistent across smaller and different samples. Bootstrapping was carried out using an unrestricted random sample of individuals selected from the 1998, 2008 and combined 1998-2008 LD datasets. Each of these samples was replicated in 100 separate datasets and then combined to form a final sample for analysis of the single and combined study years.

The final stepwise models presented in this paper are from the combined year (1998-2008) bootstrapped LD analyses (see Table 3.5). The results of the 2008 bootstrapped LD analyses are contained in Table 3.7 and the 1998 bootstrapped LD analyses are presented in Table 3.10. For the

results of the combined 1998-2008 LD analyses, the reader is referred to Table 3.6. The single year LD results can be found in Tables 3.8 (2008) and 3.11 (1998). The results of the 2008 and 1998 MI analyses can be found in Tables 3.9 and 3.12, respectively.

Results

Figure 3.1 depicts the various analytic sample sizes for each step of the analyses conducted, as well as for the overall sample and sample sub-sets. The demographic characteristics of the final combined 1998-2008 bootstrapped LD sample are described in Table 3.3. The sample was predominately male (60%), white (66%) and non-Hispanic (93%). The majority of the sample was high school educated (67%), one-fifth were employed (20%) and over one-third were unstably housed (41%). The age of the sample was evenly distributed across all categories. The overwhelming majority of the sample (81%) was enrolled in non-rehabilitation treatment programs, such as detoxification or outpatient programs. Less than one-fifth (19%) of the sample was receiving MAT, and just over one-quarter reported having a psychological problem. Heroin was the most commonly used drug (71%), followed by cocaine/crack (35%) and synthetic opioids (33%). Close to half of the sample (43%) reported current IDU at the time of admission. The majority of the sample (53%) was uninsured and had no reported income (43%). The overwhelming majority of the sample (85%) were enrolled in substance use treatment programs in states that provided Medicaid coverage of methadone. As detailed in Table 3.4, individuals receiving treatment in states with Medicaid coverage of methadone were more likely to be male, black, other race, high school educated, unstably housed, older, enrolled in outpatient or detoxifications programs, receiving MAT, reporting heroin and cocaine/crack use, using 1 or 2 substances, an IDU, have Medicaid coverage or private insurance, report public assistance, retirement/pension or other income as their primary source of income and receive substance use

treatment in states with a higher rate of methadone programs and opioid dependent individuals in treatment.

Findings from the unadjusted bivariate and adjusted multivariate logistic regression analyses are displayed in Table 3.5. Given the large number of significant associations, only significant predictors with OR<0.5 or OR≥2.0 will be explored in detail.

Model 1 tested the unadjusted association between the main predictor of interest, Medicaid coverage of methadone, and MAT utilization. This association was significant and indicated that being enrolled in substance use treatment programs in states with Medicaid coverage of methadone was associated with an increased odds of MAT utilization (OR=4.79; 95% CI 4.14-5.54).

In Model 2, Medicaid coverage of methadone was examined along with the addition of demographic characteristics including sex, race, ethnicity, education, marital status, employment, unstable housing and age. Medicaid coverage of methadone remained a significant predictor of MAT use in this model (OR=4.48; 95% CI 3.87-5.54). In addition, age was also significant, with individuals younger than 24 years old less likely to use MAT than individuals that were 45 years of age and older (OR=0.32; 95% CI 0.28-
0.36).

Model 3 examined Medicaid coverage of methadone along with the demographic variables in Model 2 and the addition of predictor variables related to substance use and treatment, including treatment program type, MAT use, psychological problems, the total number and type of substances used at the time of treatment admission and whether the person was injecting drugs at the time of admission.

Medicaid coverage of methadone continued to be associated with an increased odds of MAT utilization (OR=3.03; 95% CI 2.58-3.56). Individuals using heroin (OR=5.64; 95% CI 4.77-6.62), non-prescription methadone (OR=8.94; 95% CI 7.17-11.08), synthetic opioids (OR=3.94; 95% CI 3.39-4.58) and reporting

one drug of abuse at treatment entry, as compared to individuals reporting three drugs (OR=4.18; 95% CI 3.65-4.77) also had an increased odds of using MAT. Attending a rehabilitation program, as compared with non-rehabilitation programs such as detoxification or outpatient (OR=0.17; 95% CI 0.14-0.20), and younger age, particularly individuals less than 24 years age, as compared to 45 and over (OR=0.33; 95% CI 0.29-0.38), were associated with a decrease in the odds of using MAT.

Model 4 included all of the predictor variables contained in the previous models, as well as the addition of health insurance coverage and primary source of income. In this model, Medicaid coverage of methadone (OR=3.16; 95% CI 2.69-3.73), heroin use (OR=5.75; 95% CI 4.88-6.8), non-prescription methadone use (OR=8.25; 95% CI 6.63-10.31), synthetic opioid use (OR=3.90; 95% CI 3.36-4.55) and reporting one (OR=4.44; 95% CI 3.88-5.09) or two (OR=2.03; 95% CI 1.83-2.24) drugs of abuse at treatment entry, as compared to reporting three drugs, were all associated with an increased likelihood of MAT use. Attending a rehabilitation program, as compared to detoxification or outpatient programs (p=0.16; 95% CI 0.14-0.19), and younger age, particularly being less than 24, as compared to individuals 45 and over (OR=0.33; 95% CI 0.29-0.38), continued to be associated with a decreased likelihood of MAT use in Model 4.

Model 5 contained all variables utilized in the previous four models as well as the addition of structural variables related to the state environment, including the rate of methadone treatment programs, rate of opioid dependent individuals in treatment and the percent of residents receiving Medicaid. The addition of these structural variables strengthened the association between Medicaid coverage of methadone and MAT use (OR=6.11; 95% CI 5.03-7.4). In addition, use of heroin (OR=6.44; 95% CI 5.41,7.66), non-prescription methadone (OR=7.17; 95% CI 5.70,8.98), synthetic opioids (OR=3.90; 95% CI 3.32-4.57) and benzodiazepines (OR=2.03; 95% CI 1.69-2.44), as well as reporting one drug of abuse at treatment entry (OR=4.35; 95% CI 3.77-4.96), as compared to three drugs, were all associated with increased odds of MAT use. Similar to Model 4, attending a rehabilitation program, as compared to

detoxification or outpatient programs (OR=0.16; 95% CI 0.14-0.19), and younger age, specifically being less than 24 years age, as compared to individuals 45 and over (OR=0.37; 95% CI 0.32-0.42), continued to be associated with decreased odds of MAT use.

Model 6 included the variables used as predictors in Model 5, as well as the addition of the variable time to account for any differences in the two time periods. In this model, Medicaid coverage of methadone continued to be associated with an increased likelihood of MAT use (OR=6.42; 95% CI 5.267.78), as did heroin use (OR=6.42; 95% CI 5.37-7.61), non-prescription methadone use (OR=7.17; 95% CI

5.74-9.05), synthetic opioid use (OR=3.94; 95% CI 3.36-4.63), benzodiazepine use (OR=2.01; 95% CI 1.682.43) and reporting one drug of abuse at treatment entry (OR=4.35; 95% CI 3.81-5.01), as compared reporting three drugs. Enrollment in a rehabilitation program, as compared to detoxification or outpatient programs (p=0.16; 95% CI 0.14-0.19), and being less than 24 years age, as compared to 45 and over (OR=0.37; 95% CI 0.32-0.42), continued to be associated with a decreased likelihood of MAT use.

Model 7 included all of the predictor variables from Models 1-6 as well as the addition of an interaction term for Medicaid coverage and time. The interaction term was not significant in this model; however, Medicaid coverage (OR=5.37; 95% CI 3.72-7.76), use of heroin (OR=6.36; 95% CI 5.39-7.63), non-prescription methadone (OR=7.24; 95% CI 5.69-8.98), synthetic opioids (OR=3.97; 95% CI 3.34-4.6) and benzodiazepines (OR=2.03; 95% CI 1.67-2.42), as well as reporting one drug of abuse at treatment entry (OR=4.39; 95% CI 3.79-4.99), as compared to three drugs, all continued to be associated with an increased odds of MAT use. Finally, utilizing a rehabilitation program, as compared to detoxification or outpatient programs (p=0.16; 95% CI 0.14-0.19), and being less than 24 years age, as compared to 45 and over (OR=0.37; 95% CI 0.32-0.42), continued to be associated with a decreased odds of MAT use.

Discussion

This study tested the hypothesis that receiving substance use treatment in a state with Medicaid coverage of methadone would increase the likelihood of MAT use among opioid dependent individuals. The findings from this study support this hypothesis. Across all seven models, Medicaid coverage of methadone was significantly associated with higher odds of using MAT for treatment.

In addition to Medicaid coverage of MAT, several variables remained significantly associated with higher odds of MAT utilization across models, but did not have an OR$\geq$2.0. These variables included being Hispanic, married, employed, cocaine use, benzodiazepine use, reporting two substances of abuse at admission, as compared to three, having no health insurance, receiving substance use treatment in states with an increased number of methadone programs and receiving treatment in a state with an increased percentage of Medicaid beneficiaries. Significant variables that were associated with reduced odds of MAT use across all study models, but did not have an OR<0.5, included being male, identifying as other race, as compared to white, being between 25-34 years old and 35-44 years old, as compared to being over 44 years old, reporting psychological problems, having a retirement/pension or no income as the primary source of income, receiving substance use treatment in a state with fewer opioid dependent individuals and receiving substance use treatment in 1998 as compared to 2008. The significant factors associated with increased odds of MAT use in the final model of this study that are consistent with the literature include older age[61,62], being married[71], using heroin[60,64], crack/cocaine use[61], and having Medicaid coverage[62]. Factors in this study that were associated with reduced odds of MAT use that are consistent with the literature include being male[61,62,71] and black[62]. Contrary to previous findings, this study found increased odds of MAT utilization among IDUs[62] and no association between unstable housing and MAT use[62,64].

The positive association between age and increased odds of MAT use that was found in this study, and has been observed in other studies, is particularly noteworthy given the current opioid

epidemic. While the average age of individuals attending substance use treatment in the United States is 35 years old, recent trend data from TEDS-A indicate that between 2002 and 2012, the largest increase in treatment admissions due to heroin use was among 20-34 year old non-Hispanic whites.[1] Given the steady increase in the number of young opioid users over the last decade, and the importance of providing the most effective treatments to opioid dependent individuals as early on in their drug using careers as possible, it is critical that medication assisted treatments are available and accessible to young opioid users. Given this finding, and the precipitous increase in the use of opioids by young people in the United States, future research investigating the reasons for low MAT utilization among this population is critical.

Limitations

This study is subject to several limitations. The primary purpose of this study was to test the association between state Medicaid coverage of methadone and the use of methadone treatment by opioid dependent individuals. However, the TEDS-A does not distinguish between methadone and buprenorphine use; rather, these treatments are lumped together in one question about MAT use. In 1998, methadone was the only approved MAT available for the treatment of opioid dependence in the United States; however, in 2008 buprenorphine was also available. An affirmative response to MAT use in the 2008 TEDS-A could indicate either methadone or buprenorphine treatment. In the 1998 analysis (Table 2A.10), Medicaid coverage of methadone was associated with an increased likelihood of MAT utilization (OR=2.33; 95% CI 2.06-2.62). In the 2008 analysis (Table 2A.8), this association was also significant, but stronger (OR=8.16; 95% CI 6.51-10.22). The strengthening of this association could be the result of several factors; however, it is possible that the increased association between study years is due to the inclusion of buprenorphine in the MAT question. Given this, this study may be subject to response bias due to the double-barreled question regarding MAT use in the 2008 TEDS-A.

Another limitation of the TEDS-A data is that they do not represent the universe of treatment admissions in the United States. Rather, the majority of TEDS-A data come from publicly funded substance use treatment programs. Most privately owned treatment facilities, which account for approximately twenty-nine percent of outpatient methadone programs in the United States, are not included in TEDS-A.[201] The exclusion of privately funded substance use treatment programs may reduce the external validity of the findings in this study.

Finally, missing data was a significant issue in this study. In order to address this limitation, MI and LD were performed on each single year sample. Additionally, bootstrapping was conducted on the LD samples to validate these findings. Due to the large sample size in the combined year analyses, MI could not be performed. In comparing the results across the three 1998 analyses, the associations between Medicaid coverage of methadone and MAT utilization were consistent, with the bootstrapped LD (Table 3.10), LD (Table 3.11) and MI analyses (Table 3.12) indicating that individuals receiving treatment in states with Medicaid coverage of methadone had approximately twice the odds of using MAT, as compared with individuals in states with no Medicaid coverage of methadone. The findings across the 2008 analyses were also consistent regarding the significant association between Medicaid coverage of methadone and MAT utilization; however, in the 2008 MI analysis (Table 3.9), the odds ratio was 2.59 (95% CI 2.54-2.65), compared to 8.00 (95% CI 7.08-8.99) in the LD analysis (Table 3.8) and 8.16 (95% CI 6.51-10.22) in the bootstrapped LD analysis (Table 3.7). In light of the variability in effect sizes across the 2008 analyses, combined year analyses presented in this paper should be interpreted with caution.

Despite the limitations of the TEDS-A, it is the only national data set containing substance use treatment admissions. These data are widely used by researchers and federal agencies to gain a better understanding of the characteristics of individuals enrolled in substance use treatment in the United States. The findings presented here, while subject to limitations, utilized TEDS-A data to provide a novel investigation of the association between structural factors and MAT utilization.

Conclusion

Despite strong evidence supporting the effectiveness of MAT for treating opioid dependence, MAT utilization has decreased over the last decade. During the same time period, opioid use and dependence have increased significantly, particularly among non-Hispanic whites between the ages of 20-34. In this study, MAT use was negatively associated with age, such that individuals younger than 44 years old were less likely to utilize MAT as compared with individuals 45 and older. Understanding the factors associated with decreased utilization of MAT may help increase the availability and accessibility of these treatments, which may help to reduce the public health consequences of opioid dependence.

Chapter 8: Discussion and Conclusion

The purpose of this dissertation was twofold: (1) to provide a state-level examination of the influence of factors related to the need for substance use treatment, and the extent to which the economic environment of states are correlated with Medicaid coverage of methadone and buprenorphine; and, (2) to investigate the impact that Medicaid coverage of these treatments has on individuals seeking substance use treatment in the United States, in terms of the amount of time a person waits to enter substance use treatment and the extent to which opioid dependent individuals utilize MAT.

This chapter provides an overview of the study findings presented in Chapter 5, 6 and 7, policy recommendations related to these findings, limitations to this dissertation and a discussion of future research directions based on this work.

Discussion of Results

Is the economic situation of a state correlated with Medicaid coverage of methadone or buprenorphine? The findings of these analyses were mixed. Two measures, FMAP and per capita income, were significant across all study years for both methadone and buprenorphine, indicating that states with greater wealth were more likely to cover methadone or buprenorphine for Medicaid beneficiaries. The correlation between substance use treatment block grant funding, annual state expenditures and Medicaid coverage of methadone or buprenorphine were not consistent, varying in the year-to-year analyses, as well as across measures. The final measure of state wealth, the percent of residents receiving Medicaid, was not correlated with Medicaid coverage of methadone or buprenorphine in any study year. The lack of consistent findings across the remaining three economic variables and respective treatment types may provide evidence for a weak relationship between these

variables, or they may indicate that they are poor proxy variables for state wealth. The percent of residents receiving Medicaid and amount of substance abuse block grant funding states receive only capture the wealth, or lack thereof, of a portion of a state's population; whereas, per capita income and FMAP rate serve as more general indicators of population wealth. Further research using these and other novel proxy measures for state wealth can provide additional evidence as to the extent of the relationship between state wealth and Medicaid coverage of methadone or buprenorphine.

Is the need for opioid treatment correlated with Medicaid coverage of methadone and buprenorphine? The results regarding need for treatment, particularly for methadone, were also inconsistent. For methadone, the rate of opioid dependent individuals was correlated with an increased likelihood of Medicaid coverage in 1998 and the combined year analysis; however, the confidence intervals in these analyses were quite large and as such indicate a weak relationship. Similarly, while there was a consistent correlation between the rate of methadone programs and Medicaid coverage of methadone across all study years, the confidence intervals associated with each of these analyses were also very large. Finally, there was no relationship between either need factor and Medicaid coverage of buprenorphine.

Is Medicaid coverage of methadone or buprenorphine associated with shorter wait times for substance use treatment entry? For both methadone and buprenorphine, Medicaid coverage was associated with a significantly longer wait time. Individuals enrolled in substance use treatment in states with Medicaid coverage of methadone waited 219% longer than individuals in states without Medicaid coverage. For buprenorphine, the wait time was 344% longer for individuals enrolled in substance use treatment programs in states with Medicaid coverage, as compared to individuals in states without Medicaid coverage. While these findings do not confirm the study hypothesis, additional research is warranted and should include the proportion of all individuals in substance use treatment in each state, rather than a subset of in-treatment individuals.

Other factors associated with increased wait times for the methadone analysis include being male, other race, as compared to white, employed, unstably housed, less than 18 years old or between 25-44 years old, as compared to individuals over 44, reporting one substance of abuse, as compared to three, having Medicaid, Medicare or no insurance, as compared to private insurance, having retirement/pension or other income as the primary income source, as compared with a salary and receiving treatment in 2008, as compared to 1998. Factors that were associated with a decrease in the mean number of days individuals waited to enter treatment in the methadone analysis included being Hispanic, attending outpatient or detoxification programs, as compared to rehabilitation, utilizing MAT, reporting no substances of abuse at the time of treatment, as compared to three and having no income, as compared to having a salary as the primary source of income.

Variables that were associated with increased treatment wait time in the buprenorphine analysis, include younger age, reported psychological problems, heroin use, synthetic opioid use and Medicare and no health insurance (as compared with private insurance). Factors that were associated with a decrease in the mean number of days individuals waited to enter treatment included being male, black (as compared to white), Hispanic, being employed, use of MAT, detoxification and outpatient program enrollment, as compared to enrollment in a rehabilitation program, opioid use, reporting one substance of abuse, as compared to three and reporting public assistance, retirement/pension, other income source or no income, as compared to salary as the primary source of income.

Is Medicaid coverage of methadone associated with an increase in the utilization of MAT? The results of this analysis indicate that Medicaid coverage of methadone is associated with increased odds of MAT utilization. Other factors that were associated with increased odds of MAT utilization include being Hispanic, married, employed, using heroin, non-prescription methadone, cocaine, synthetic opioids, benzodiazepines, reporting one or two drugs of abuse, as compared with three, and having

Medicaid or no insurance, as compared with private insurance. Factors associated with decreased odds of MAT use include being male, black or other race, as compared to white, less than 44 years of age, attending a rehabilitation program versus a non-rehabilitation program (detoxification and outpatient), reporting psychological problems, having retirement/pension or no income as the primary source of income, as compared to salary and receiving treatment in 2008, as compared to 1998.

Policy Recommendations

Based on the main findings of this dissertation, the following policy recommendations are proposed:

Finding: State wealth is correlated with Medicaid coverage of MAT

The results from Aim 1 (Chapter 5) indicate a significant relationship between increased state wealth and Medicaid coverage of MAT. This finding was consistent across both the methadone and buprenorphine analyses and all study years. In addition to these findings, recent data regarding prescribing patterns for opioids demonstrate that states with the highest levels of opioid prescribing, which serves as a proxy for prescription opioid use, also have some of the lowest per capita incomes and highest FMAP rates in the country.[211] Further, two of the five states with the highest rates of opioid prescribing did not cover either methadone or buprenorphine and three of the five states only provided Medicaid coverage of methadone *or* buprenorphine, but did not cover both.[9]

Recommendation:

1. **Increase reimbursement incentives for Medicaid coverage of MAT in states with less overall wealth in order to increase access to evidence based treatments for opioid dependence.**

Finding: Substance use treatment entry wait time averaged between 5-6 days

One of the most important findings from the Aim 2 analysis (Chapter 6) was the fact that individuals waited, on average, 5-6 days to enter substance use treatment. Prior research has found that the first 24 hours following a person's initial contact with a treatment program is the most critical in order to engage and maintain an individual in substance use treatment.[92] Given the increase in opioid use and dependence, novel approaches are needed to increase treatment capacity and continuity in order to reduce the amount of time that individuals wait to enter substance use treatment. The following two regulatory issues serve as impediments to expeditious entry into MAT programs.

MAT pre-authorization: The majority of state Medicaid programs require that pre-authorization of buprenorphine treatment must be obtained prior to a person initiating treatment as well as when they renew their prescription. Physicians and treatment programs have argued that this policy is unnecessarily onerous and contributes significantly to both delays to treatment entry, as well as interruptions in the continuity of MAT.[212,213] These pre-authorization requirements may prevent individuals from initiating treatment altogether, and may also expose individuals that are already maintained on buprenorphine treatment to interruptions in their treatment regimen, which in turn could increase their risk of relapse.

Recommendation:

1. **Streamline or remove pre-authorization requirements for preferred providers or Medicaid beneficiaries with existing prescriptions in order to reduce delays to initiating or continuing buprenorphine treatment.**

Lack of integration of opioid treatment into the primary medical care system: Prior to the passage of the DATA 2000 and approval of buprenorphine in 2002, MAT in the United States was limited only to

methadone, which was administered at opioid treatment programs (OTPs) that were typically segregated from other types of medical care. Many experts believe that this segregation increased the stigmatization of opioid users and created additional barriers to treatment accessibility.[51–53,214] While DATA 2000 and the approval of buprenorphine have helped to integrate substance use treatment into more mainstream medical settings, the restrictions on the administration of methadone remain in place. Additionally, the waiver requirements that doctors must complete in order to become buprenorphine prescribers have been identified as a barrier to becoming a buprenorphine provider.[79–81,84–86] Both the restrictions on methadone provision and requirements for buprenorphine provision likely contribute to the lack of available programs and providers, as well as the low utilization of MAT, which in turn contributes to longer waiting times across substance use treatment services.

Recommendations:

1. **Allow for the administration of all forms of MAT in primary care settings.**
2. **Provide incentives and/or subsidies to physicians in areas with limited MAT availability to prescribe buprenorphine.**

Finding: Younger age is associated with both an increase in treatment wait time and decreased odds of MAT use

The Aim 2 analysis (Chapter 6) indicated that individuals under the age of 18 experienced a 92% increase in treatment wait time, as compared to individuals over 44 years of age. In the Aim 3 analysis, as age decreased, so did the odds that an opioid dependent individual would use MAT. These findings, coupled with the fact that TEDS-A data from 2002-2012 show the largest increase in treatment admissions due to heroin use among 20-34 year olds[1], suggest that increased efforts are required in order to reach and engage younger opioid users in substance use treatment. Such efforts could include an increased use of outreach services that specifically target younger opioid users, with an emphasis on

educating young opioid users about their options for substance use treatment services, including accurate information regarding the effectiveness of each modality. Additionally, substance use treatment

Recommendations:

1. **Amend state and federal budget policies so that substance use treatment programs can be reimbursed for outreach services that target hard-to-reach groups who are disproportionately impacted by substance use.**
2. **Provide incentives for substance use treatment programs to expand their programming capacity to provide specialized services to younger substance users.**

Finding: Enrollment in a substance use treatment program in a state with Medicaid coverage of methadone is associated with an increased odds of MAT use

Findings from the Aim 3 analysis (Chapter 7) demonstrated that for an individual enrolled in a substance use treatment program in a state with Medicaid coverage of methadone, the odds of them enrolling in MAT was 5 times greater than for an individual receiving treatment in a state without Medicaid coverage of methadone (OR=5.37). This finding suggests that the coverage options offered by insurance companies influence the types of treatments that opioid users utilize.

As of 2013, buprenorphine was covered in all 50 states for Medicaid beneficiaries; however, methadone was only covered in 30 states. Such policies that limit coverage options employ a "one size fits all" model, despite the fact that the appropriateness and satisfaction of each treatment varies across individuals. Limitations to the types of substance use treatment may lead to an increased likelihood of relapse if the treatments that are covered by Medicaid do not work for particular individuals.

Recommendation:

1. **Require that at least two MAT options are available to Medicaid beneficiaries.**

Limitations

This dissertation project served as an initial exploration of state-level influences on Medicaid coverage of methadone and buprenorphine treatment, and the impact of this coverage on the utilization of substance use treatment. While novel, this study is subject to several limitations.

The design of this study was constructed based on the availability of the primary variable of interest, Medicaid coverage of methadone and buprenorphine. Longitudinal Medicaid coverage data across multiple years were not publicly available. Because of this, the analyses for all three aims of this dissertation were limited to the two time periods that state Medicaid coverage data were publicly available for each treatment type (1998 and 2008 for methadone, and 2006 and 2008 for buprenorphine).[9,54,142] This limitation reduced my ability to detect causality and the immediate and direct effects of changes in Medicaid coverage of each treatment, given that I was unable to determine the exact timing of any changes in Medicaid coverage.

The Treatment Episodes Data Set-Admissions served as my primary data source for this study, and there are noteworthy limitations to the TEDS-A. First, the TEDS-A is consists of data reported primarily by publicly funded substance use treatment facilities to the SAMHSA, as per state requirement.[122] Most privately owned treatment facilities, of which approximately 29% of outpatient methadone programs are in the United States, are not required to report their treatment data as per state regulations, and are therefore not likely to be included in the TEDS-A.[201] This limitation may have introduced selection bias into both the methadone and buprenorphine analyses given that only a portion of private programs are required to report their admission data.[122] Further, the TEDS-A does not contain treatment episodes from private practice physicians or those physicians operating outside of licensed substance use

treatment programs. In 2012, only 19% of buprenorphine clients received their treatment from an opioid treatment program (OTP); therefore, the overwhelming majority of buprenorphine clients are not included in the TEDS-A.[215] Given this, it is conceivable that the individuals contained within the TEDS-A that received buprenorphine treatment are different from the overall population of buprenorphine patients in the US. This may limits the generalizability of the analyses presented in Chapter 6 and 7.

When data collection began for the TEDS-A, methadone was the primary MAT provided in the United States. When buprenorphine was introduced in 2002, the TEDS included buprenorphine within an existing question regarding MAT, rather than differentiating between methadone and buprenorphine. Including a double-barreled question is likely to result in response bias, particularly for analyses such as these that seek to differentiate between the two treatment types.[216] The TEDS-A response structure for MAT limited my ability to explore the utilization of each treatment separately in the Chapter 7 analyses. Because of this, the findings regarding methadone utilization in 2008 and the combined 1998-2008 analyses may be overestimated given that the outcome variable, MAT use, likely included some individuals utilizing buprenorphine treatment.

The TEDS-A contains a combination of patient self-reported responses as well as program-reported responses. (Justin Gaertner, SAMHDA User Support, personal communication, April 7, 2015). Variables that are self-reported may be subject to social desirability bias, given the sensitive nature of many of the items, including self-reported psychological problems. Additionally, some variables in the TEDS-A may also be subject to recall bias given that some questions refer to past behavior. Variables that may be impacted by recall bias include self-report of substance use at admission and number of prior treatment episodes.

A final limitation of the TEDS-A is that a significant amount of data were missing, particularly for the treatment wait time and health insurance coverage variables. These missing data may introduce bias, particularly when performing analyses using listwise deletion. Both listwise deletion and multiple

imputation were employed prior to analyses to handle missing data in the analyses presented in Chapter 6 and 7; however, the sample was first limited to individuals receiving substance use treatment in states with ~50% missing data on any one variable included in the analyses. Sub-setting the sample to individuals in a select number of states may have introduced a threat to external validity given that individuals residing in states that were excluded based on significant missing data may be different from the individuals residing in states with ~50% or less missing data for any one variable.

Despite the limitations associated with the TEDS-A, it serves as the most comprehensive source of individual-level data regarding substance use treatment admissions in the United States. Additionally, the TEDS-A is the only dataset that provides individual-level data on treatment wait times across the United States.

A final limitation associated with the datasets utilized in this study comes from the UFDS and NSSATS. Similar to the TEDS-A, there is a known bias associated with the substance use treatment programs included in the UFDS and N-SSATS datasets. The UFDS and N-SSATS datasets were used to calculate the rate of methadone and buprenorphine programs per state. The response rate for these surveys was significant (88% in 1998; 97% in 2006; and, 94% in 2008); however, similar to the TEDS-A, the UFDS and N-SSATS do not include private physicians that are not contained within or affiliated with a substance use treatment program. Given this, the association between the rate of buprenorphine programs and Medicaid coverage is likely to be underestimated.

While this dissertation is subject to several limitations, it provides an important contribution to the literature regarding the impact of Medicaid coverage on opioid dependent individuals. While prior research has documented the ways in which Medicaid coverage restrictions of methadone and buprenorphine impact substance use treatment facilities, to date we are not aware of any study investigating the impact of Medicaid coverage of these treatments on substance users engaged in treatment.

Future Directions

Previous research has investigated individual and program-level factors that are associated with wait time to enter substance use treatment and MAT utilization. This dissertation adds to that literature by both confirming and refuting some of the previous findings. This dissertation also provides a novel contribution to the literature through the investigation of Medicaid coverage of methadone and buprenorphine, the wait time associated with substance use treatment entry and MAT utilization. While the analyses conducted for this dissertation are historical, they reflect a time when opioid use and substance use treatment admissions were increasing, but MAT utilization was decreasing. This is particularly important given the public health significance of opioid use in the United States and the relatively low utilization of the most evidence-based approaches to treating opioid dependence.

The analyses in this dissertation were preliminary and were subject to several limitations. The lack of publicly available secondary data regarding Medicaid coverage of methadone and buprenorphine treatment was a significant limiting factor in the design of this study. Future research might include primary data collection with State Medicaid administrators regarding Medicaid coverage patterns over repeated years in order to conduct a more rigorous analysis of the impact of Medicaid coverage of methadone and buprenorphine on individuals seeking substance use treatment.

This dissertation did not include any analyses since the passage of the PPACA, most specifically since 2014 when substance use treatment became an Essential Health Benefit. Future analyses should explore the availability of methadone and buprenorphine post-PPACA implementation for Medicaid beneficiaries as well as privately insured individuals. There is significant hope that the passage of the PPACA will improve access to and utilization of substance use treatment; however, the variability in the availability of treatment modalities will undoubtedly persist. Future research should investigate changes

to the availability of methadone and buprenorphine treatments, potentially comparing the utilization of these evidence based treatments before and after PPACA implementation.

Finally, while this dissertation investigated Medicaid coverage of methadone and buprenorphine as a dichotomous variable, future research might include a more nuanced definition of this variable. In some states Medicaid programs cover methadone and/or buprenorphine treatments, but the use of them is limited by pre-authorization requirements for treatment initiation or restrictions to the length of time that individuals can use them.[213] These restrictions could have a significant impact on treatment engagement, utilization of MAT and treatment outcomes. Future studies might define Medicaid coverage as a polytomous variable, including categories such as full coverage, no coverage, restricted coverage, or even more specifically, restricted coverage based on lifetime limits and restricted coverage based on pre-authorization. Creating a more specific definition of the ways in which Medicaid coverage is restricted might result in an increased ability to detect the specific impact of these restrictions.

Conclusion

This dissertation provided an historical analysis of the availability of the two most effective treatments for opioid dependence during a time when both nonmedical use of prescription opioids and heroin use increased significantly in the United States. The impetus for this study was to better understand why some states provided coverage of methadone and buprenorphine for Medicaid beneficiaries while others did not, and how Medicaid coverage of these treatment impacted opioid dependent individuals' access to treatment. While this study had limitations, particularly based on the availability of complete and multi-year data, it addressed a significant gap in the literature by examining factors related to Medicaid coverage at the state-level and the impact of this coverage on individuals enrolled in substance use treatment.

Since 2008, significant progress has been made with respect to substance use treatment and

Medicaid coverage. In 2008, the Paul Wellstone and Pete Domenici Mental Health Parity and Addiction Equity Act of 2008 (MHPAEA) was passed, paving the way for elimination of differential benefits for substance use treatment as compared to those placed on medical/surgical benefits. Additionally, in 2010, the PPACA was passed, paving the way for the expansion of Medicaid coverage to an increased number of individuals in thirty one states and the prioritization of substance use treatment as an essential health benefit. These policy changes have been considered unprecedented by substance use treatment experts[217] because of their potential to significantly increase access to substance treatment services. However, while these policies provide incredible opportunities for reducing barriers to treatment, it is critical that we remain cautiously optimistic because an expansion of coverage does not necessarily equal an increase in accessibility or utilization. In Massachusetts, for example, where universal health insurance was provided to nearly all state residents prior to the passage of the PPACA, admissions to substance use treatment programs, which had been expected to increase significantly, remained flat.[218] Since the early 2000s, substance use treatment admissions for opioids have increased steadily, yet since the passage of PPACA, the total number of substance use treatment facilities has decreased, from 17,204 in 2010 to 14,630 in 2013, as has the utilization of MAT.[219,220] In order to keep pace with an expansion in the population of individuals with health insurance that are in need of substance use treatment, there must be a concurrent expansion in services in order to ensure that substance use treatment is accessible. Future research should monitor the impact of the expansion in Medicaid coverage, the prioritization of substance use treatment as an EHB and the extent to which the passage of the Parity Act are impacting substance use treatment access.

Abstract

Healthy Beginnings:
Exploring the impact of parental stress and relationship quality on birth outcomes

By

Advisor: Mary Clare Lennon, Ph.D.

This dissertation consists of three studies exploring the effects of maternal and paternal experiences of stress and perceptions of relationship quality on length of gestation and birth weight. The first study assessed the association of parental relationship quality with the baby's length of gestation and birth weight among 2,072 families in the Fragile Families and Child Wellbeing study. Romantic relationships can be a substantial source of social support as well as stress, and have been shown to influence many health outcomes. Beyond crude relationship characteristics, however, few studies have assessed the association of other dimensions of relationship quality, such as conflict and support, with birth outcomes. No studies have assessed the association of father's report of relationship quality with birth outcomes. In this study, multilevel linear regression analyses found that babies born to fathers who were present at their birth were born significantly heavier and had a longer gestation. The results also showed that greater paternal relationship conflict was associated with lower gestational age among all couples and lower birth weight among unmarried couples.

The second study investigated the association between parental stress during pregnancy with their baby's length of gestation and birth weight among a sample of 270 young couples in southern Connecticut. Many studies have shown that women's experiences of stress during pregnancy are associated with preterm birth and low birth weight; however, men's experiences have largely been ignored. Structural equation modeling of the association between maternal and paternal stress latent variables and birth outcomes showed that greater paternal stress was significantly associated with longer gestation and greater birth weight, while maternal stress was not significantly associated with

these outcomes. The findings from the first two studies suggest that men's experiences and feelings when they are expecting a baby may have a unique contribution to birth outcomes.

The third study assessed the association between parental stress during pregnancy and their own and their partner's poor health behaviors and depressive symptoms among a sample of young couples in lower Connecticut. Many unhealthy behaviors, such as substance use, develop during adolescence and evidence shows that stress is a contributing factor. This association has not been established among pregnant adolescents and little attention has been paid to male partners. Among a sample of 294 young expectant couples, multilevel modeling showed that one's own experiences of stress were associated with more unhealthy behaviors and depressive symptoms for both members of the couple. Cross-over effects were also evident—paternal stress was predictive of more maternal conduct problems, while maternal stress was predictive of less paternal substance use and more depressive symptoms. These findings highlight the importance of social relationships and interactions on health behaviors.

Overall, the results of the three studies suggest that father's experiences during pregnancy matter to their baby's health, and that experiences of stress during pregnancy may impact an expectant couples' own and their partner's health behaviors. This dissertation research treated men's experiences during pregnancy, including experiences of stress and relationship quality, with equal weight to women's experiences when it came to their impact on birth outcomes and health behaviors. Future, research, programs and policies aimed at improving birth outcomes may be strengthened by the inclusion of expectant fathers.

Dedication

To NAME REDACTED, for giving me strength and perspective.

Acknowledgements

I would like to thank my committee members, who provided relentless support, encouragement and expertise. Mary Clare Lennon (sponsor), Jennifer Dowd, Heidi Jones and Trace Kershaw: You are each role models, with an unprecedented set of research skills and knowledge, a talent for mentorship that pushed me along the way and, perhaps most importantly, you each have a great sense of humor that helped keep me sane along the way. I am lucky to have such an outstanding committee to guide me. A special thanks to Mary Clare Lennon for not only facilitating the dissertation process, but for also challenging me to try new statistical methods, and think of alternative explanations and perspectives. Also for taking the time to do things like sit down with me to write out equations using pencil and paper, send me links to relevant research and opportunities, and write me recommendations for funding. Jennifer Dowd, thank you for introducing me to stress research and for always guiding me to consider the real life applications of my findings. Heidi Jones, thank you for your thoughtful reviews of my work—my work was always stronger and richer after addressing your comments. Trace Kershaw, thank you for giving me my start in academic research. As a mentor to me for nearly ten years, I truly appreciate the countless hours you have invested in teaching me new skills and guiding my career.

I wouldn't have finished this degree without the support from my fellow CSH cohort members: NAMES REDACTED. You always had just the right words of encouragement and never missed a chance to celebrate successes and blow off steam with a little karaoke. I am lucky to have pursued this journey alongside such strong, smart and funny women.

Thank you to my in-laws, NAMES REDACTED, for encouraging me along the way and for watching Lydia so that I could spend more hours researching and writing toward the end.

Mom and Dad, both by example and through your parenting, you taught me that through hard work and persistence I could achieve whatever I set my mind to (besides a vocal career). Thank you for

sacrificing so that I could have opportunities to grow and challenge myself academically and athletically. It is through these experiences and with your unrelenting love and support that I had the opportunity to pursue and achieve this dream.

And finally, NAME REDACTED, you were with me through it all as my biggest supporter. Thank you for always being there through the highs and lows, and for always reminding me I could do it. I love you.

Chapter I. Introduction and Background

a. Overview and Specific Aims

This dissertation research aims to assess the impact of parental stress on birth outcomes. Despite substantial national prevention efforts, the rates of preterm birth (PTB) and low birth weight (LBW) are higher today than they were two decades ago in the United States (U.S.). These negative birth outcomes disproportionately affect minority populations, cost the U.S. hospital system over $16.8 billion annually and have health effects that persist into adulthood. Improvements in rates of traditional risk factors (e.g. smoking, prenatal care) have not corresponded to improved rates of PTB and LBW, suggesting that other factors are at play. Maternal stress during pregnancy is one such factor that is consistently associated with PTB and LBW. Research has focused on maternal stress and the influence of fathers has been ignored, despite increasing evidence that fathers play an important role in their children's health and development.

This research aims to assess the association of several dimensions of maternal and paternal stress with PTB and LBW, and the psychosocial pathways through which stress affects these outcomes. From a stress and coping framework, it also aims to assess how relationship quality is associated with PTB and LBW. This is the first research to assess the effect of direct report of paternal experiences of stress and relationship quality on birth outcomes. It is also the first research of its kind to use dyadic data analysis methods to parcel out the independent and interactive effect of each parent among couples—particularly among young couples who may be more susceptible to stress and its effects on birth outcomes.

The specific aims of this dissertation research are:

Aim 1: Assess the association of maternal and paternal reports of relationship quality with the gestational age at birth and birth weight of their baby among families in the Fragile Families and Child Wellbeing study.

Aim 2: Investigate the association between maternal and paternal stress during pregnancy with the gestational age at birth and birth weight of their baby among a sample of young couples in southern Connecticut.

Aim 3: Investigate the association between maternal and paternal self-reported stress during pregnancy and their own and their partner's negative health behaviors among a sample of young couples in southern Connecticut.

b. Stress and Preterm Birth and Low Birth Weight

b.1 Public Health Impact

Ensuring the health of our populations starts with ensuring the health of our children even as early as their development in the womb. Preterm birth (PTB; <37 weeks gestation) and low birth weight (LBW; <2,500 grams) are the leading causes of neonatal mortality in the United States (U.S.) today.[1] More than one in 1,000 live births result in infant death due to disorders related to short gestation and low birth weight.[2] Alarmingly, the rate of preterm birth has increased by 21% since 1981 despite substantial national prevention efforts.[3] In addition, every Healthy People initiative since the program's inception in the 1970s has included the goal of reducing the rates of LBW;[4–7] however, the 2013 rates of PTB (11.38%) and LBW (8.02%)[8] were over 50% higher than the 2010 Healthy People target rates of 7.6% and 5.0%, respectively.[4]

The costs of preterm birth and low birth weight are substantial to both individuals and society. Infants born preterm are at greater risk for neonatal morbidity, such as temperature instability, respiratory distress, feeding difficulties, jaundice and Periventricular Leukomalacia (death of white brain matter).[9,10] Evidence also shows that children born preterm and/or with a low birth weight continue to be at an increased risk for developmental delay[11] and behavioral problems during childhood.[12] These same infants are also at increased risk for chronic medical and social disabilities into adulthood, such as cerebral palsy,[13] major psychological disabilities,[13] asthma[14] and cardiovascular problems.[15]

The financial costs of preterm birth and low birth weight are also massive. The average cost for a very pre-term baby is over $190,000 for medical care in the baby's first year alone.[16] As a society, total costs for medical care resulting from preterm birth exceed $16.8 billion annually in the U.S. alone (in 2005 U.S. dollars). This figure does not include the substantial long term educational and productivity costs to individuals and society as a whole.[16] When including early childhood medical care costs, early

intervention services, special education and household and labor market productivity losses due only to the four most common conditions associated with preterm birth, the cost estimate exceeds $26 billion in 2005 U.S. dollars[16] and has likely escalated since.[17,18]

b.2 Rationale for exploring stress as a contributor to PTB and LBW

Researchers have searched for many years to identify potential targets for interventions to reduce the rates of preterm birth and low birth weight in the U.S. Smoking and access to prenatal care, for example, have long been shown to affect birth outcomes on an individual level.[19,20] On a population level, however, while we have successfully reduced rates of smoking during pregnancy and improved access to and use of prenatal care, the rates of PTB and LBW continue to remain high despite these improvements. For example, between 1990 and 2002, the rates of preterm birth and LBW in the U.S. both increased by about 15%,[21] while the rates of maternal smoking declined 38% during this same time period.[22] Other researchers have hypothesized that high rates of negative birth outcomes may be due to changing demographics of childbearing (e.g. increased maternal age and use of assisted reproductive technologies leading to more multiple births) and changes in obstetrical interventions, which have led to more pre-term C-sections and a lower intrauterine fetal death rate.[23–25] These factors certainly contribute to but do not completely explain the high rates of PTB and LBW.[25]

In an effort to identify other potential underlying causes of PTB and LBW, researchers have been exploring the role of maternal stress for many years. The hypothesis that a woman's psychological state during pregnancy may affect the health of her baby dates back to Hippocrates;[26] however, the first published studies defining a link between maternal stress and birth outcomes emerged in the 1950s and research has intensified in the last 40 years.[27] The general premise is that stress causes physiological

and behavioral changes in the pregnant mother that impact the developing fetus and the timing of parturition.

Indeed, greater maternal perceived stress has been associated with physiological changes in the pregnant mother, such as increases in cortisol and cytokine production, which are both thought to play a role in fetal growth and parturition.[28–30] Epidemiological evidence also shows that maternal stress during pregnancy is consistently predictive of negative birth outcomes, including PTB[27,28,31–33] and LBW.[27,31,34,35] The epidemiological evidence, which is discussed in greater detail later in this chapter, varies greatly in the study designs, populations and methodology employed; however, it appears that the size of the effect of maternal stress on PTB and LBW is equivalent to that of other well-established risk factors (e.g. sociodemographic and behavioral factors) for PTB and LBW.[36] In fact, based on the existing evidence, the American Congress of Obstetricians and Gynecologists recommends screening for psychosocial stress as part of prenatal care, citing that it may play a role in PTB and LBW.[37]

Certain U.S. populations are disproportionately affected by severe and chronic stressors and are at increased risk for PTB and LBW. For adolescents and young adults who are racial and/or ethnic minorities, live in urban areas and are from a low socioeconomic status (SES), daily stressors often extend beyond these typical developmental challenges. This population is disproportionately affected by other more severe and chronic stressors, such as neighborhood problems, racism and discrimination.[38] Teen mothers in the U.S. are more likely than older mothers to give birth prematurely and/or have a baby with a low birth weight. In 2013, just under 13% of mothers age 15-19 gave birth preterm (PTB) compared to 10.8% of mothers age 20-34. Additionally, 9.3% of mothers age 15-19 had a baby with a LBW compared to 7.7% of mothers age 20-34.[39] Non-Hispanic black mothers were also more likely than white mothers to have a baby with PTB (16.3% vs. 10.2%) and LBW (13.1% vs. 7.0%).

b.3 Current Prevailing Conceptual Model and Pathways

Stress is an interactive process in which environmental demands exceed one's adaptive capacity, resulting in psychological and physiological changes that can lead to poor health outcomes.[40] The stress process is characterized by three major components: a stressor, an appraisal or perception of the stressor, and a response.[41] Stressors can interact with a person's psychological state, disposition, social support, genetics, as well as their social and environmental context.[42]

Dunkel-Schetter and Lobel[43] offer the most comprehensive framework depicting the pathways through which maternal stress may influence PTB and LBW (Figure I-1). The conceptual model describes how both chronic (persistent or recurrent difficulties over the long term) and acute (discrete threats that are shorter term) stressors can influence birth weight and gestational age at delivery. DunkelSchetter and Lobel's framework synthesizes findings from a large literature examining individual stress components and birth outcomes. Previous studies, however, have been inconsistent in terms of how stress is conceptualized, if a conceptual model is attended to at all, and no studies have assessed all components of this model, including stress exposures, appraisal, responses and birth outcomes.

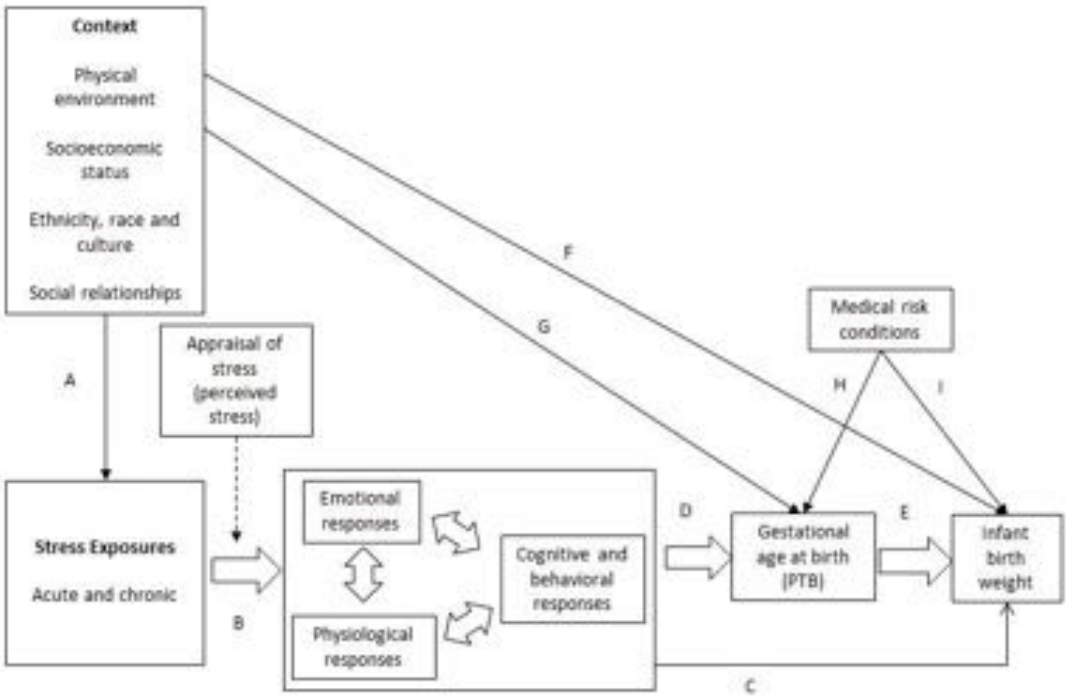

Figure I-1. Conceptual model of stress and birth outcomes. Reproduced from Pregnancy and Birth Outcomes: A multilevel analysis of prenatal maternal stress and birth weight. In: *Handbook of Health Psychology (2nd Edition)* (p.451), by Dunkel-Schetter and Lobel, 2012, New York: Springer.[43]

As depicted in Dunkel-Schetter and Lobel's (2012) model above,[43] the three most commonly hypothesized pathways through which stress affects birth outcomes include behavioral, emotional and physiological responses, which are all interrelated.[43,44] Each of these pathways is described below.

Behavioral Responses

Studies have shown that stress consistently predicts negative health behaviors (e.g. smoking, substance use, dietary habits, physical activity) among both non-pregnant[28,45] and pregnant women.[43,46] These negative health behaviors, which may serve as stress coping mechanisms,[41] are consistently related to adverse birth outcomes. For example, smoking and substance use (cocaine in particular) are well-

documented predictors of PTB,[19] and inadequate nutrition and smoking are risk factors for LBW.[20,43]

Few studies have assessed the full mediational pathway of stress, health behaviors and birth outcomes.[35] One study among an ethnically diverse sample of women, used structural equation modeling (SEM) to show that pregnancy-specific stress (e.g. feeling bothered, worried or upset by whether you might have an unhealthy baby; or paying for the baby's clothes, food or medical care) was not directly related to birth weight, but was predictive of cigarette smoking (unstandardized B=0.22) and cigarette smoking was inversely related to birth weight (unstandardized B=-0.15).[47] In the same study, pregnancy-specific stress was directly predictive of gestational age (GA) at birth (unstandardized B=-0.18) and this association did not change when accounting for smoking.[47] This study suggests that stress may have both a direct physiological effect on birth outcomes and an indirect effect through health behaviors, particularly smoking.

Emotional Responses

Lazarus (2000) described how there are at least fifteen emotions that can result from stress, including sadness, shame and anxiety.[48] These emotions can result from negative appraisals or perceptions of stress. Epidemiological literature shows that stress is consistently associated with increased depressive symptoms among both men and women,[49] and among pregnant women.[50] As Figure I-1 depicts, depressive symptoms may affect both behavioral and physiological responses, and ultimately risk for negative physical health outcomes (Figure I-1),[40] including reproductive health outcomes.

A 2010 meta-analysis of 29 published studies showed that women with depression during pregnancy are at a modest, but statistically significant, increased risk for PTB, LBW and intrauterine growth restriction (IUGR).[51] This meta-analysis estimated that the relative risks increased by 39%-49%

depending on the outcome. To put the magnitude of the effect of major depression or clinically significant depressive symptoms on birth outcomes in perspective, this increase in risk for PTB and LBW is comparable to the increased risk for PTB posed by smoking ten or more cigarettes per day.[52,53]

Physiological Responses

Neuroendocrine

While the relationship between stress and negative birth outcomes has been studied for decades, the precise physiological pathways remain poorly understood.[29] The majority of studies, using both animal and human models, have focused on the endocrine system, and specifically the hypothalamic-pituitary-axis (HPA), which regulates the physiological response to stress through the release of glucocorticoids such as cortisol. This mechanism can become dysregulated under conditions of chronic stress, leading to chronically elevated levels of cortisol in the system.[28]

In pregnant women, the HPA axis is altered to protect the development of the fetus. The secretion of cortisol *stimulates* the secretion of other glucocorticoids in pregnant women, while in the non-pregnant state cortisol shuts off the production of more glucocorticoids.[29] A premature surge of glucocorticoids, which could result from environmental stress, can enter fetal circulation and cause a series of endocrine events, leading to PTB.[28] Evidence demonstrates that elevated levels of corticotropin-releasing hormone, a glucocorticoid involved in the HPA-axis stress response, predicts spontaneous preterm birth, even when controlling for traditional obstetric risk factors.[30] The physiologic pathway between stress and LBW (that is not due to PTB) is less clear; however, evidence from animal studies show that exposure to glucocorticoids, even in short duration, can reduce fetal growth. Studies have shown anywhere between 15%-32% reduction in size across sheep, monkey, rat, mice, and rabbit models, with the effect varying by frequency and quantity of exposure, and animal model.[54,55]

Immune System

The endocrine system also interacts with the immune system,[56] and research shows that psychosocial stress affects immune responses in both non-pregnant humans and animals.[29] Unlike in non-pregnant humans, women's immune systems are altered during pregnancy.[29] Despite important changes in immune system function during pregnancy, little research has examined the role of the immune system in mediating the relationship between stress and fetal development.[29,57] In a recent review of studies linking stress and circulating inflammatory markers (part of the immune response), Christian and colleagues reported only one small study by Coussons-Read et al. (n=24) measuring this association, which found that perceived stress was associated with higher circulating levels of proinflammatory cytokines and lower levels of an anti-inflammatory cytokine among pregnant women in the late first/early second trimester.[58] Christian et al. reported two other studies, one by Ruiz et al. reporting crude differences and one by his research group controlling for pre-pregnancy BMI, both demonstrating that depression was associated with higher circulating levels of pro-inflammatory cytokines.[59,60]

There are several hypothesized pathways through which stress may affect birth outcomes through the inflammatory/immune response. An inflammatory response may trigger preterm delivery by causing preterm contractions, cervical ripening and membrane rupture.[29] Inflammation may also cause hypertension and subsequently preterm birth.[29] Further, stress may increase maternal susceptibility to infection, which can initiate preterm delivery.[27] One such infection, bacterial vaginosis, has been linked to greater risk for spontaneous preterm delivery.[61] The release of catecholamines (an inflammatory response) may also decrease the amount of nutrients the fetus receives and ultimately reduce fetal growth.[28]

b.4 Paternal experiences of stress and their influence on birth outcomes

A large body of literature, described above, has documented that women's experiences of stress during pregnancy are associated with negative birth outcomes;[27,28,31–34,43] however, research has also demonstrated that the perceptions of stress and coping strategies are affected by social relationships.[62] The relationship with the baby's father is often an important social relationship in an expectant woman's life. While an increasing number of mothers are not married when their child is born, over 80% of unmarried women are in a relationship with the baby's father during pregnancy,[63] even among adolescents.[64,65] Thus, a woman's male partner—married or not—is usually an important social relationship during pregnancy and he likely has a substantial influence on the expectant mother during this time.

Despite the importance of male partners during pregnancy, very little research has explored paternal influences in general on birth outcomes.[66] Figure I-2, adapted from Misra (2010),[67] depicts the hypothesized pathways through which paternal factors can influence birth outcomes. Research that has assessed paternal influences on birth outcomes has narrowly focused on paternal demographic characteristics, occupational exposures and "paternal involvement," each of which is most often reported by the mother, introducing concerns about measurement error. A 2010 review by Shah et al. identified 38 studies assessing several paternal factors (age, height, BMI, birth weight, occupation, education and alcohol use) and risks for PTB, LBW and small for gestational age (SGA).[66] Of the eight paternal factors, only three were consistently associated with birth outcomes: extreme paternal age (<20 and >40) was consistently associated with greater risk for LBW, but not consistently with PTB and SGA; greater paternal birth weight consistently predicted greater infant birth weight; and greater paternal height was associated with greater infant birth weight.[66] All of these factors are hypothesized to act through the germ cell line and, thus, through Path a depicted in Figure I-2. Shah's review presents

a rather limited conceptualization of the types of paternal factors that have been considered as contributors to birth outcomes.

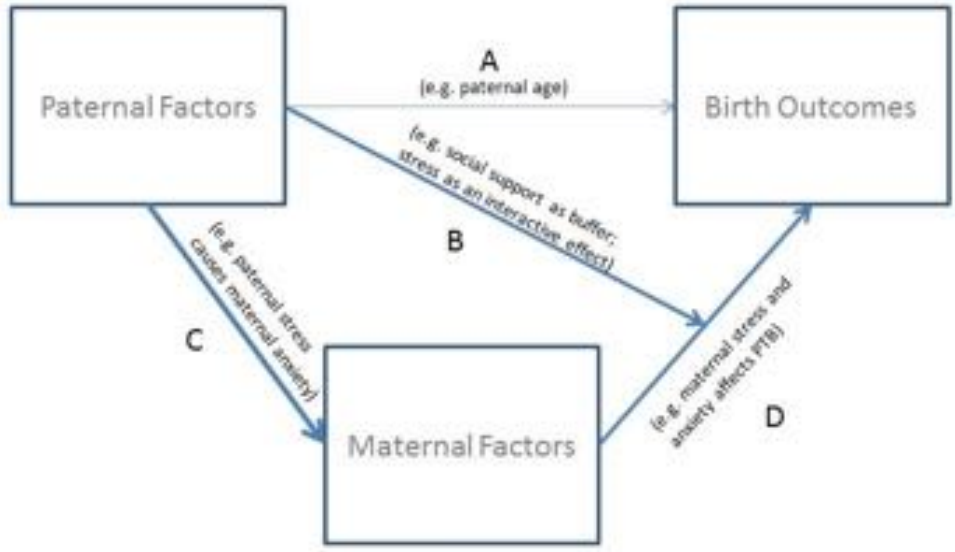

Figure I-2. Conceptual framework of pathways of paternal influence on birth outcomes. Adapted from "Do fathers matter? Paternal contributions to birth outcomes and racial disparities" by D.P. Misra et al. 2010, *American Journal of Obstetrics & Gynecology 202*(2),p.100.[67] Thick lines indicate pathways of interest in this dissertation.

Research examining the impact of maternal stress on birth outcomes that *has* included paternal factors has been limited to *maternal reports* of paternal involvement and support, with the premise that paternal involvement and support reduces maternal stress during pregnancy, thus decreasing the risk for negative birth outcomes.[68] More involved fathers may provide more social support, which has been demonstrated to be an independent predictor (as reported by the mother) of positive birth outcomes, as well as a buffer of the relationship between stress and negative birth outcomes.[69,70] This research is based on the hypothesized pathway depicted by lines B and D in Figure I-2. There is, however, concern about measurement error when we rely solely on maternal report of paternal factors. There could be a

large discrepancy between maternal and paternal report of paternal social support. Maternal report of paternal factors may be more tied to her own psychological state than the true actions of her partner.

In support of the premise that paternal involvement and support can affect maternal psychological health and thus birth outcomes, Alio and colleagues (2010) reviewed seven published studies and found that paternal involvement (measured in various ways across studies) was consistently related to a reduction in the risk for LBW and SGA, in addition to more positive maternal prenatal health behaviors (which may mediate the relationship between paternal involvement and birth outcomes).[68] In addition, a retrospective case-control study of over 2,200 singleton births to mostly Latina women in Los Angeles showed that women with moderate to high partner support during pregnancy (maternal report of how much the baby's father showed he cared for her, did not criticize her and supported her financially during pregnancy) had lower odds of PTB compared to women with low partner support adjusted for several sociodemographic and behavioral factors (aOR=0.73, 95% CI 0.52, 1.01).[71] The retrospective report of partner support however, may be biased by the pregnancy outcome, thus inflating the effect estimate of partner support on PTB. Further, the measures of paternal involvement and support, however, are often crude (e.g. father's name on birth certificate) and reported by the pregnant mother.[68,71]

Men's experiences of stress during his partner's pregnancy may also influence birth outcomes through his effects on maternal psychosocial factors.[67] This pathway is depicted by lines C and D in Figure I-2 below. In fact, substantial evidence supports the theory that among couples, stress experienced by one member can cross-over and affect the well-being of the other member.[72] For example, a woman's partner's stress with his friends may cross-over and impact her own depression.[72] The closeness of a couple may also moderate the cross-over effect, with closer couples experiencing more cross-over of the effects of stress from one member to the other.[73] Much of this research has focused on the cross-over of

one's work stress to the other's well-being[72] and relationship satisfaction (e.g. Neff[74]); however no studies have documented this process among expectant couples, and none have assessed the impact of paternal stress during pregnancy on birth outcomes via effects on maternal well-being.

b.5 Epidemiological Evidence

Preterm Birth

Some recent reviews of the epidemiological literature demonstrate that higher levels of maternal stress predict PTB.[27,28] In Beydoun and Saftlas' 2008 review, nine of eleven human studies found an association between prenatal stress and length of gestation, preterm labor or preterm birth.[27] Littleton's 2010 meta-analysis found that psychosocial stress was not significantly associated with risk for PTB across 13 studies (crude *r* (13)= .04; 95% CI=-0 .03, 0.11).[75]

More recent studies have reported evidence supporting the association between stress and PTB. A prospective cohort study of 1,800 married Chinese women delivering after 32 weeks gestation found that the women reporting the highest levels of severe stressful life events in the first (aRR=2.40; 95% CI 1.13, 5.09) and second trimesters (aRR=2.86; 95% CI 1.26, 6.47) were more likely to experience PTB than women with no life event stress during that time, adjusting for maternal age, education, income, social support, negative coping and infant gender.[31] Women in this study reported on the events in one survey conducted after their third trimester clinical visit referring to events occurring in all trimesters.[31] This method is not truly prospective and there may be measurement error due to the misclassification of the timing of the events. A different prospective cohort study of 415 pregnant English-speaking women from Los Angeles reported that an increase in perceived stress between assessments at 18-20 weeks and 30-32 weeks gestation was a significant predictor of preterm birth when adjusting for race and parity

(aOR=3.08; 95% CI 1.51, 6.28).[32] Further, in a Danish population-based study, the burden of life stress (B=-0.14; 95% CI -0.19, -0.10) and emotional symptoms (e.g. anxiety, nervousness) (B=-0.04; 95% CI -0.07, -0.004) during pregnancy assessed around 30 weeks gestation significantly predicted fewer days of gestation after adjusting for maternal age, socioeconomic status, infant gender, pre-pregnancy body mass index, parity, hypertension, diabetes, and smoking.[33]

Low Birth Weight

The epidemiological evidence supporting the association between stress and LBW is less consistent than the evidence supporting the association with PTB.[28] Low birth weight can result from being born early, from growth restriction in the womb, or both.[43] Thus studies vary in whether they assess crude birth weight and low birth weight (regardless of GA), birth weight adjusted for GA, small for gestational age (SGA), and intrauterine growth restriction (IUGR). The latter two measures are assessments of whether the baby weighs less than 90% of other babies at the same GA.[76]

Beydoun and Saftlas (2008) report that of ten studies, nine identified a significant negative association between prenatal stress and birth weight or fetal growth restriction, most controlling for several important confounders, but not all adjusting simultaneously for maternal age, race/ethnicity, SES, smoking and infection.[27] Littleton's meta-analysis found that psychosocial stress was significantly associated with neonatal weight in 14 studies, (crude *r*= -.07; 95% CI=-.13, -.01) and with low birth weight in 5 studies (crude *r*= -.07; 95% CI=-.03, -.10).[75]

More recent studies have reported less consistent results. Zhu and colleagues (2010), in a study of 1,800 married Chinese women delivering after 32 weeks gestation, found that the perceived impact of severe stressful life events experienced in the first trimester only (reported in one survey after their third trimester clinical visit assessing events in all trimesters) predicted lower birth weight (B=-99.09; 95% CI -137.98, -60.20).[31] Tegethoff, in a study of a Danish population-based birth cohort, alternatively found that

the burden of life stress during pregnancy assessed at about 30 weeks gestation significantly predicted an *increased* birth weight adjusted for GA, maternal age, socioeconomic status, infant gender, pre-pregnancy body mass index, parity, hypertension, diabetes, and smoking (z-score, B=9.14; 95% CI 4.99, 13.28). Emotional symptoms (e.g. anxiety, nervousness) were not significantly predictive of birth weight adjusted for GA in this study.[33] In another study of 294 low-income women delivering in nine Illinois counties, Bryant Borders et al. (2007) reported that several psychosocial factors, including food insecurity (aOR=2.6, 95% CI 1.7,3.5), having a child with a chronic illness at home (aOR=3.1, 95% CI 2.3,4.0), being unemployed (aOR=3.7, 95% CI 2.7,4.7) and poor coping skills (aOR=4.0, 95% CI 3.1,4.9) significantly predicted low birth weight after adjusting for maternal age, while social support, depression and perceived neighborhood safety were not significantly related to low birth weight.[34] Notably, food insecurity may not only be measuring the effect of a stressor on the birth outcome—not having enough food can also directly affect fetal growth by affecting the caloric and nutritional substrate available to the developing fetus.[77]

b.6 Characterization and Measurement of Stress and Emotional Responses

Despite prolific epidemiological research on stress and birth outcomes, studies of the impact of stress on birth outcomes are inconsistent in terms of how stress is conceptualized, if a conceptual model is attended to at all, and, consequently how stress is measured. Most studies of maternal prenatal stress to date have focused on major life event stress (e.g. death of a family member or friend), chronic stressors (e.g. neighborhood problems, racism/discrimination), daily hassles, catastrophic disasters (e.g. terrorist acts), perceived stress, depression and anxiety (including pregnancy-specific anxiety). A review by Chen and colleagues (2011) of 138 studies focused on psychosocial stress and either PTB or LBW, found that the studies used 85 different instruments to measure stress.[78] The widely varying

conceptualization and measurement of stress is likely a major driver of inconsistencies in findings and effect sizes in studies associating stress with birth outcomes,[79] such as the lack of effect on risk for preterm birth found in Littleton's meta-analysis.[80] The major domains of stress and stress responses that are most commonly measured and their associated measurement concerns are discussed below.

Major Life Event Stress

Life event inventories, in which the respondent checks off major life events that they have experienced in a given time frame, are the most common method for capturing levels of external stress exposures.[81] The premise of checklist inventories of stressful life events is the hypothesis that a person's level of experienced stress is the result of the cumulative level of change or readjustment elicited by events happening in their life.[82,83] Research in this area is based on Selye's (1956) argument that environmental events elicit biological changes—changes that, even in small amounts but close in time, can influence susceptibility to negative health (mental and physical) outcomes.[84] Initially researchers posited that any event (either positive or negative) that elicited change or readjustment produced experiences of stress that had implications for health. While positive life events may play some role in producing stress, over time checklist inventories evolved to focus, almost entirely, on negative events after substantial research demonstrated that positive events were only weakly associated with health outcomes, while negative events were much more strongly associated with health outcomes.[85]

<u>Measurement Considerations</u>

There are several measurement considerations when using checklist inventories of stressful life events to quantify stress exposures. First, it is important that inventories contain a list of events that are tailored to the context of the participants (in terms of their roles, contexts and cultures) and the outcome of interest.[81] Tailoring the events in the inventories improves the instrument sensitivity and relevance to

the population.[81] Second, the checklist should also be as comprehensive as possible. If an event that adds to stress is not included, the estimation of the level of stress may be inaccurate.[86] Third, assessing the timing of the events is important in research on stress and birth outcomes, particularly because pregnancy is a sensitive period characterized by rapid fetal development and physiological changes that may affect sensitivity to stressors.[28,29]

Checklist inventories are challenged by several other measurement concerns. Role occupancy can affect the likelihood of event exposure and is particularly relevant in studies of pregnant women.[81] For example, parents with more children are more at risk for experiencing life events related to child care. As such, parents reporting more social roles will experience more stress by virtue of their increased role occupancy.[81] The problem with this is that people with more social roles may be more likely to assume those roles because they have more social competence. Thus, inventories of stressful life events would be confounded with social competence. While we expect the number of experiences of stressful life events to be associated with *more* adverse birth outcomes (one possible health outcome), social competence would (theoretically at least) be related to fewer adverse birth outcomes, and thus the estimate of the effect of stressful life events on adverse birth outcomes would be muted.[72] Studies should adjust for role occupancy to estimate a more accurate effect of stress on the health outcome of interest.[81]

In addition, there is concern that checklist inventories do not accurately ascertain the amount of stress produced by an external stressor. For example, it is probable that certain events (e.g. death of a family member) may produce more stress than others (e.g. having an argument with a family member). Some researchers argue for subjective weighting of events; however applying subjective weights may result in confounding of the stress exposure with coping (or vulnerability to stress). A subjective weight of a stressor may be a function of the ability to resolve the stressor either emotionally or through action

(i.e. coping), and thus subjective ratings confound the effects of stress mediators with stress exposures.[81] Other researchers argue for regression-based weighting, in which the events are weighted in the total index by their effects on the outcome, with a responding criticism that this tactic is not theoretically driven and the weights are not generalizable across studies.[81] Turner and Wheaton argue that unweighted indices are as useful as weighted indices in predicting health outcomes citing evidence that effect sizes are similar, and suggest separately assessing the external stressor and the stress mediators (e.g. coping mechanisms).[81]

Perceived Stress

Measures of stress appraisals and perceptions ascertain the individual's perception and evaluation of potential harm posed by the external demand and their ability to cope with the demand.[71] Constructs typically measured in research on birth outcomes include perceived stress and the psychological impact of stressors.[78] The most common scale measuring general perceived stress is Cohen's Perceived Stress Scale.[78,87] The Perceived Stress Scale includes ten items that assess the degree to which the respondent feels certain situations are stressful (e.g. how often do you feel nervous or stressed, how often do you feel you are unable to control important things in your life).[88]

An issue when assessing the influence of stress appraisals and perceptions on health outcomes is that the instrument is actually measuring individual traits that would be expressed regardless of a stress stimulus.[89] In other words, stress appraisals and perceptions may be highly tied to personality traits that make people more or less reactive to stressors (e.g. self-efficacy or optimism). As such, when we measure perceived stress, we may actually be measuring other personality variables. Because it is often impossible (or too late) to intervene on personality characteristics, stress appraisals and perceptions

may be more amenable to interventions and thus measures should separate appraisals and perceptions from other personality characteristics.[90]

Another concern is that many studies among pregnant women use measures of perceived stress that have not been validated among pregnant women.[78] There are two reasons this is problematic. First, pregnant women are exposed to different and additional types of stressors than non-pregnant women (e.g. travel to many appointments, concern over body appearance, learning of a problematic amniocentesis result). The appraisal and perception of pregnancy-specific stressors may be different than women's appraisal and perception of general life stressors, but both can impact health and wellbeing. Second, women's psychological and physiological responses to stress change during pregnancy,[28,29] and therefore, they may perceive or appraise stressors differently as pregnancy progresses. Thus, the validity of commonly used scales of perceived stress (e.g. the Perceived Stress Scale) may be challenged when used among pregnant women.

Depression and Anxiety

Depression and anxiety are affective responses, or more generally described as moods, which result from subjective experiences (versus moods that are more stable and more reflective of personality traits). In Cohen, Kessler and Gordon's (2004) heuristic model of the pathways through which stress affects health outcomes, affective response results from negative appraisals or perceptions of stress, which subsequently directly affect both behavioral and physiologic responses, and risk for physical and mental disease.[89] Affective states can also be viewed as buffers or enhancers of stress— they can affect the perception and appraisal of stress and people with greater affective responses may be the most vulnerable to negative health outcomes. The most commonly studied affective states in research on stress and birth outcomes are depression and anxiety, which are composed of affective and non-

affective (e.g. feeling tired) components.[78] Among studies of birth outcomes, the Center for Epidemiological Studies Depression Scale (CES-D)[91] is the most common measure of depression and the State-Trait Anxiety Inventory (STAI)[92] is the most common measure of anxiety employed in this research.

Measurement Considerations

Measures of affective response and birth outcomes have almost exclusively focused on the constructs of anxiety and depression, despite affect being composed of a wide range of dimensions, such as sadness, happiness, and calmness.[89] As it stands, there is inconsistent evidence linking psychological constructs (such as depression and anxiety) with birth outcomes,[78] and even less evidence that these constructs mediate or moderate the effect of external stressors on birth outcomes. It is also possible, though not well studied, that certain affective responses are associated with subsequent behavioral and physiological changes that would affect health outcomes.[89] The lack of precision in the measurement of affective responses may contribute to these inconsistent findings.

The severity of affective responses may also affect physiological and behavioral changes, although there has been little attention to the severity of anxiety and depressive symptoms that may be linked to physiological mediators and birth outcomes. While there is a plethora of research on symptoms of anxiety and birth outcomes, there has been very little research on pathological levels of anxiety.[93] Further, anxiety measures developed specifically for use among pregnant women have little theoretical basis and no tests of convergent validity, which is important given the well-documented physiological and psychological changes women experience during pregnancy.[28,29,93]

c. Expectant Adolescents and Young Adults: A Vulnerable Population

While stress is a fact of life that cuts across all populations, stress may have a more substantial effect on certain vulnerable populations. Adolescents and young adults are one such population who may be especially susceptible to the ill effects of stress for several reasons. First, adolescents and young adults are still developing and may lack effective coping skills and resources.[94] Second, pregnancy itself can be a stressor for any expectant parent,[47] but the transition to parenthood may be exceptionally stressful for adolescents because they are concurrently confronting the challenges of parenthood and adolescent development.[95] Pregnancy can also give rise to or exacerbate other stressors that may be more common among adolescents and young adults compared to older expectant parents (e.g. financial concerns for supporting a new baby, relationship problems).[96] Third, during adolescence and young adulthood, social relationships outside of the family, including romantic relationships, become increasingly important.[97] An adolescent's romantic partner plays an important role in the attachment, support, and caregiving behavioral systems.[98] Most expectant adolescents and young adults are involved with the baby's father during pregnancy;[65] however they are still learning to interact with their partner and developing their relationship skills[98] and therefore negotiating this relationship may be a significant source of stress for this population compared to older adults.

There is very little research exploring experiences of young expectant fathers, even though a partner's pregnancy is also a major life transition for expectant fathers. A young man's experiences during his partner's pregnancy may influence his own health and behavior, as well as his pregnant partners' health and behavior, carrying implications for the health and development of their baby. Despite this, the paternal experience during pregnancy, particularly among adolescent and young adult fathers, has largely been ignored in the literature. As described previously in this chapter, when the

father's experience is acknowledged, it is usually reported by the expectant mother, introducing potential measurement error.

d. Romantic Relationship Quality and Birth Outcomes

d.1 The Influence of Relationship Quality on Birth Outcomes

Like stress, relationship quality has been associated with a variety of health outcomes, including cardiovascular disease,[99] inflammation[100] and impaired immune function.[100] It follows that relationship quality may affect reproductive health, including birth outcomes. Pregnancy is a sensitive period characterized by many psychological and physiological changes for the mother, and rapid development of the fetus. Relationship dynamics that buffer, cause or exacerbate stress may have an effect on both maternal and child health.

While there is a large body of research demonstrating the influence of relationships on general health,[58] there is little research examining the link between relationship quality and birth outcomes. Studies have focused on relationship characteristics that are easier to measure, such as marital status. Many studies have shown that married women tend to have better birth outcomes than unmarried women;[101] however, beyond married couples tending to have a higher socioeconomic status, we know little about *how* being married contributes to better birth outcomes.

Two aspects of relationship quality that may be important are support and conflict. Paternal support and involvement during pregnancy, measured by maternal report or other crude measures, has been shown to be associated with greater infant birth weight[68,102,103] and longer gestation.[68,71] Increased father support and involvement may reduce maternal stress[27,75] and influence pregnant women's health

behaviors (e.g. smoking, attending prenatal care appointments),[43,46,68] ultimately influencing birth outcomes. Measures of paternal involvement were consistently related to lower odds of LBW, the infant being small for gestational age (SGA), and more positive maternal prenatal health behaviors in a recent review of seven studies.[68] These studies measured paternal support via crude proxies for involvement, such as inclusion of father's name on birth certificate[104] and whether the father contributes financially during pregnancy.[102]

Conflict is a second dimension of parental relationship quality that could potentially affect birth outcomes through their effects on maternal stress. While social support may buffer the effects of stress on birth outcomes, conflict may cause psychological distress leading to negative health behaviors and/or physiological changes that increase risk for poor birth outcomes.[62] Little research, however, has explored if and how relationship conflict during pregnancy affects birth outcomes.

d.2 Measurement of relationship quality

Most studies of relationships and birth outcomes have used crude measures of relationship characteristics as proxies for relationship quality, including marital status, cohabiting status, father's name on birth certificate, father's presence at the child's birth, etc. These characteristics, however, tell us little about the actual quality of a couple's relationship. Relationship quality is more generally defined as the subjective, global evaluation of a relationship.[105] Measures of relationship quality were developed from research on married couples, but they have since been applied to romantic couples in general. Spanier's Dyadic Adjustment Scale (DAS) is one such measure, which asks respondents to evaluate multiple components of their relationship, which make up four constructs: consensus, satisfaction, cohesion, and affectional expression.[106]

Most often, scores on relationship satisfaction measures, including the DAS, are treated as a unidimensional construct, such that lower scores indicate less relationship quality or satisfaction (note these terms are used interchangeably in the literature) and higher scores indicate more relationship satisfaction.[105] Fincham and Rogge (2010) argue that relationship quality may be more accurately measured by two distinct dimensions: positive and negative relationship qualities.[105] These feelings about a relationship may be experienced independently and each dimension has its own information to contribute to the understanding of a relationship. In parallel, different components of relationship quality may affect health and birth outcomes through different pathways. Social support may affect health by buffering the effects of stress, while conflict may affect health by causing psychological distress, which could lead to negative health behaviors or physiological processes that increase disease risk.[62] Thus assessing both positive and negative perceptions of a relationship may give us more information about how relationships affect health. It is therefore important to measure both positive or supportive aspects of a relationship, such as their partner's encouragement and willingness to compromise, as well as negative or conflicted aspects, such as disagreements about finances, spending time together and sexual relations.

d.3 Paternal reports of relationship quality and their influence on birth outcomes

No studies have examined whether *paternal* reports of relationship quality are associated with birth outcomes. This lack of investigation ignores the possibility that paternal well-being during pregnancy matters to the health of the baby's mother and their child. When measured, relationship characteristics and paternal support are almost always reported in research studies solely by the mother. This approach is problematic for several reasons. First, asking mothers to report their partner's contributions or feelings may introduce measurement error as these are secondhand reports. Maternal

reports of her partner's feelings are likely highly influenced by her own experiences and psychological state, and therefore may differ greatly from her partner's true feelings and behaviors. Second, we are unable to assess whether there is an interactive effect of maternal and paternal reports of relationship quality on birth outcomes—for example, is having both parents report high levels of support from their partner much better than when only the mother reports high levels of support from her partner?

Finally, qualitative research has described how married couples perceive stress in relationships differently than unmarried couples. In one study by Waller,[107] when discussing tensions in their relationships, married couples perceived that conflicts were surmountable, while unmarried couples felt like the conflicts were risks to the stability of their relationship.[107] Couple disagreements or conflict may lead to more stress among unmarried couples than among married couples, and thus the same conflicts may have a different effect on birth outcomes based on the couple's marital status.

e. Approach and Methodological Considerations

Whether stress influences birth outcomes and whether parental relationships influence child outcomes, are interpersonal research questions. As such, these questions require analytical methods that extend beyond measuring individual effects. Observations about one individual also tell us something about other individuals within the social network.[108] For example, we can imagine that an expectant mother's stress is not only driven by her own experiences and characteristics, but also by the experiences and characteristics of individuals that she interacts with, including the father of her baby. Nearly all published research examining the effects of stress on birth outcomes uses reports from the expectant mother alone. A few studies examine the role of paternal support, but either use reports of this support from the mother or use crude measures of paternal support, such as the father's name being on the baby's birth certificate.[68]

Observations of expectant mothers and fathers within a couple (i.e. dyad) are linked and we cannot treat them as independent observations in analyses. This non-independence, or the inherent link between measures in interpersonal research, is the core of dyadic analysis.[108] Non-independence within dyadic data can come from multiple sources. There may be mutual influence, where each individual's outcomes affect one another. There may be a partner effect, where a characteristic or behavior of one individual affects their partner's outcomes. The partners may have a common fate, where both individuals experience the same exposures. Finally, there may be a compositional effect, where the two members of a dyad may have been similar before they paired together (e.g. people tend to have relationships with people who are similar to themselves).[108] Due to the non-independence of dyadic data, the dyad should be the unit of analysis, versus the individual.[108]

Methods such as Generalized Estimating Equations, Multilevel Modeling and Structural Equation Modeling, all used within this dissertation research, can account for this non-independence of data and can be tailored specifically to dyadic data, which has particular specifications due to the low number (two, to be exact) of units within each group.[109] GEE produces population average estimates of an effect of a predictor on the outcomes and accounts for clustering of data within couples.[72] MLM is the most flexible strategy for analyzing dyadic data because it provides direct estimates of actor (effects of someone's report on own outcomes) and partner effect (effect of someone's report on a partner's outcomes) and is able to specify model constraints.[126] SEM simultaneously assesses direct, indirect and total effects of a system of variables on an outcome. SEM can also be tailored to account for clustering of data within couples.[73] This dissertation research employs each of these techniques to account for the dyadic nature of the couple data.

f. Innovation

There are several gaps in the literature that this dissertation seeks to fill. First, this research takes into account paternal effects on birth outcomes among two populations: a national sample of married and unmarried couples and a convenience sample of adolescents and young adults. Second, while epidemiological evidence shows that married women tend to have better birth outcomes, we know little about whether more detailed facets of a parental relationship, such as conflict and support, affect birth outcomes, from a stress pathway approach. Beyond relationship characteristics, very few studies have assessed direct paternal report of their perception of their relationship and whether those reports are associated with birth outcomes. Also, no studies have looked at whether the effect of parental reports of relationship quality on birth outcome differs by marital status. Third, many studies have shown that maternal experiences of stress during pregnancy are associated with negative birth outcomes; however, a woman's relationship with the baby's father likely plays a large role in this stress process. No studies have assessed how paternal stress may impact birth outcomes through potential effects on maternal factors. Fourth, no studies have explored whether experiences of stress can crossover and affect a romantic partner's health behaviors among adolescents and young adults who are expecting a baby.

g. Dissertation Research Overview

This dissertation research aims to assess the association of several dimensions of maternal and paternal stress with PTB and LBW, and the psychosocial pathways through which stress affects these outcomes. From a stress and coping framework, it also aims to assess how relationship quality is associated with PTB and LBW. Building on the conceptual frameworks posed by Dunkel-Schetter and Lobel (2012) and Misra and colleagues (2010), I pose the following conceptual framework for this

dissertation research (Figure I-3).[43,67]

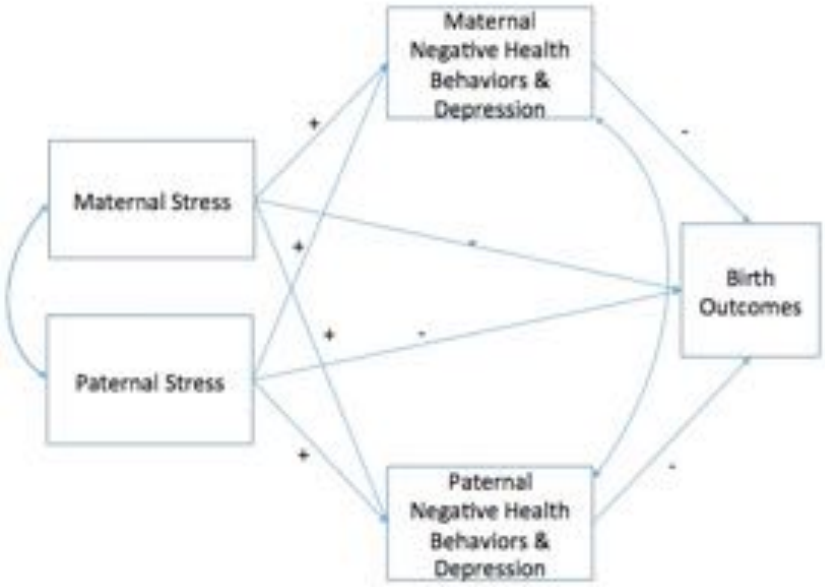

Figure I-3. Proposed conceptual model for the dissertation research assessing the effects of parental stress on birth outcomes and the behavioral and psychological pathways.

This is the first research to assess the effect of direct report of paternal experiences of stress and relationship quality on birth outcomes. It is also the first research of its kind to use dyadic data analysis methods to parcel out the independent and interactive effect of each parent among couples—particularly among young couples who may be susceptible to stress and its effects on birth and child outcomes.

The specific aims and hypotheses of this research are:

Aim 1: Assess the association of maternal and paternal reports of relationship quality with the gestational age at birth and birth weight of their baby among families in the Fragile Families and Child Wellbeing study.

Hypothesis 1.1: Relationship quality factors, such as conflict and partner support, will predict birth weight and gestational age. More conflict and less support will be associated with lower gestational age and birth weight.

Hypothesis 1.2: The association of relationship quality with infant birth weight and gestational age at birth will be moderated by marital and cohabiting status. Factors such as relationship conflict and support will have a stronger association with gestational age and birth weight among unmarried couples compared to married couples.

Aim 2: Investigate the association between maternal and paternal stress during pregnancy with the gestational age at birth and birth weight of their baby among a sample of young couples in southern Connecticut.

Hypothesis 2.1: Greater maternal and paternal self-reported stressors during pregnancy will be associated with lower infant birth weight and gestational age at birth.

Hypothesis 2.2: The association between both maternal and paternal self-reported stressors and infant gestational age at birth and birth weight will be mediated by maternal depressive symptoms.

Hypothesis 2.3: Maternal stress will interact with paternal stress, such that the influence of paternal stress on gestational age at birth and birth weight depends on maternal stress levels.

Aim 3: Investigate the association between maternal and paternal self-reported stress during pregnancy and their own and their partner's poor health behaviors among a sample of young couples in southern Connecticut.

Hypothesis 3.1: Greater maternal and paternal stress during pregnancy will be associated with greater poor health behaviors during pregnancy.

Hypothesis 3.2: Greater *partner's* stress during pregnancy will be associated with greater poor health behaviors.

Chapter II. Parental Reports of Relationship Quality and the Association with Birth Outcomes among Infants in the Fragile Families and Child Wellbeing Study

a. Introduction

Preterm birth (PTB; <37 weeks gestation) and low birth weight (LBW; <2,500 grams) are among the leading causes of infant mortality in the United States (U.S.).[110] Furthermore, infants born preterm and/or with a low birth weight are at increased risk for behavioral and emotional problems during childhood, and chronic health conditions into adulthood, such as asthma, coronary artery disease and type II diabetes.[111,112] In the U.S., 11.4% of infants are born preterm and 8.0% are born with a low birth weight.[39] Beyond the implications for the child's health and development, the costs to the U.S. healthcare system associated with these birth outcomes are staggering. Medical care costs due to PTB alone exceeded $16.8 billion in the U.S. in 2005, a figure that does not include long-term productivity and educational costs to individuals and society as a whole.[113]

Every Healthy People initiative since the program's inception in the 1970s has included the goal of reducing the rates of LBW by improving the population rates of traditional risk factors, such as smoking during pregnancy and access to and use of prenatal care.[4–7] Over the last few decades there have been substantial improvements in the population rates of these traditional risk factors; however, the rates of PTB and LBW continue to remain high. For example, between 1990 and 2002, the rates of preterm birth and LBW in the U.S. each increased by about 15%,[21] while the rates of maternal smoking during pregnancy declined 38% during the same time period.[22] This evidence suggests that there may be other factors, beyond traditional risk factors, that contribute to the risk for PTB and LBW.

Researchers have identified several psychosocial factors that have been linked to the risk for preterm birth and low birth weight, including level of social support.[28,69,70] Lack of social support during pregnancy has been related to stress and anxiety[70,114] and evidence shows that maternal stress during pregnancy is consistently predictive of negative birth outcomes, including PTB[27,28,31–33] and LBW.[27,31,34,35] For example, Feldman and colleagues (2000) demonstrated among a sample of 247 low obstetric risk women of mostly European or Hispanic ethnicity in a structural equation modeling analysis, that a latent

social support factor measured at 28-30 weeks gestation, predicted higher infant birth weight (in grams) adjusted for gestational age, marital status, education, ethnicity and obstetrical risk (standardized adjusted B=0.15; P <0.05).[69]

Romantic relationships are a substantial source of social support as well as stress,[62] and have been shown to influence many health outcomes, including cardiovascular disease,[99] inflammation[100] and immune function.[100] While an increasing number of mothers are not married when their child is born, over 80% of unmarried women are in a relationship with the baby's father during pregnancy.[115] Thus, a woman's male partner—married or not—is usually an important social relationship during pregnancy and he likely has a substantial influence on the health and wellbeing of an expectant mother during this time.

Research has shown that paternal support and involvement during pregnancy is associated with greater infant birth weight[68,102,103] and longer gestation.[68,71] Increased father support and involvement may influence birth outcomes by reducing maternal stress[27,75] and affecting pregnant women's health behaviors (e.g. smoking, attending prenatal care).[43,46,68] A recent review of seven studies found that measures of paternal involvement were consistently related to lower odds of LBW, the infant being small for gestational age (SGA) and more positive maternal prenatal health behaviors.[68] These studies measured paternal support and involvement in different ways, generally using crude proxies for involvement such as inclusion of father's name on birth certificate[104] and whether the father contributes financially during pregnancy.[102]

Paternal support is only part of how relationships can affect birth outcomes. Other dimensions of parental relationship quality, such as conflict, have the capacity to influence birth outcomes through their effects on maternal stress. Conflict may cause psychological distress leading to negative health behaviors and/or physiological changes that increase disease risk, while social support may buffer the effects of stress.[62] Little research, however, has explored if and how different dimensions of parental

relationship quality during pregnancy affect birth outcomes. As described above, studies have focused on relationship characteristics that are easier to measure, such as marital status and whether the father's name was on the birth certificate. We know little about the mechanism by which being married or having the baby's father's name on the birth certificate (beyond their associations with socioeconomic status) leads to better birth outcomes. Relationship quality is a multidimensional construct that includes dimensions such as support and conflict.[116,117] Sources of relationship support may include a partner's encouragement and willingness to compromise, while conflict may include disagreements about finances, spending time together and sexual relations. These dimensions may have unique associations with birth outcomes.

Furthermore, measures of relationship characteristics and paternal support are almost always reported in research studies solely by the mother. This approach is problematic. Asking mothers to report their partner's contributions or feelings may introduce measurement error as these are secondhand reports. We are also unable to assess whether there is an interactive effect of maternal and paternal reports of relationship quality on birth outcomes—for example, is having both parents report high levels of support from their partner much better than when only the mother reports high levels of support from her partner?

In addition, we cannot assume that each facet of relationship quality affects birth outcomes the same way among couples in different types of relationships. Qualitative research has described how married couples perceive stress in relationships differently than unmarried couples. In one study by Waller,[107] when discussing tensions in their relationships, married couples perceived that conflicts were surmountable, while unmarried couples felt like the conflicts were risks to the stability of their relationship.[107] Couple disagreements or conflict may lead to more stress among unmarried couples than among married couples, and thus the same conflicts may have a different effect on birth outcomes based on the couple's marital status.

The Current Study

This study uses data from both maternal and paternal reports among married and unmarried couples in the Fragile Families and Child Well-Being study to, first, explore whether multiple dimensions of parental relationship quality during pregnancy are associated with their baby's birth weight and gestational age at birth. I hypothesize that both maternal and paternal reports of fewer couple activities, more conflict, less partner support and less relationship satisfaction will be associated with lower birth weight and earlier gestational age at birth.

Second, this study aims to look at the interactive effect of maternal and paternal reports of relationship quality on these birth outcomes. I hypothesize that when both parents report high levels of partner support, relationship satisfaction and couple activities there will be greater positive association with birth weight and gestational age than when only the mother reports high levels of these dimensions. I also hypothesize that when both parents report high levels of couple conflict there will be a more negative association with birth weight and gestational age than when only the mother reports high levels of couple conflict.[1]

Third, this study aims to assess whether the association of parental relationship quality with birth outcomes differs among married and unmarried couples. I hypothesize that both maternal and paternal reports of couple conflict will have a greater negative association with birth weight among unmarried couples than among married couples.

[1] An alternative hypothesis could be that the difference between the parents' perception of the relationship that influences maternal stress and, subsequently, birth outcomes. This hypothesis would assume that when the father has a positive perception of the relationship and the mother does not has an equal effect on birth outcomes as when the mother has a positive perception of the relationship and the father does not. This dissertation focuses on the interaction between the maternal and paternal reports of relationship quality based on the perspective that both parents' indication of a poor relationship probably indicated the most troubled relationships with the most stress, and thus these couples will have the worst birth outcomes. This dissertation also takes the perspective that there may be differential effects on birth outcomes depending on which parent reports a negative perception their relationship.

b. Methods

b.1 Data Source

Overview and Sampling

Data for the analyses come from the Fragile Families and Child Well-Being Study (hereon referred to as Fragile Families).[118] IRB approval to use the de-identified Fragile Families survey and medical record data was obtained from the CUNY Graduate Center Human Research Protections Program. The Fragile Families and Child Well-Being Study is an ongoing longitudinal study following a national sample of new parents and their children born between the years 1998 and 2000. The study used a stratified random sample of cities with 200,000 or more people, with hospitals sampled within the cities and births sampled within the hospitals. The cities were stratified according to a scoring system that accounted for variability in the policy environments and labor market conditions within the cities. In several cities, births were sampled from all hospitals; in a few cities, hospitals were excluded for cost and efficiency reasons if the hospital had few births. In New York and Chicago, hospitals with over 1,000 non-marital births per year were randomly selected. Random samples of births were taken within each sampled hospital based on quotas that matched the percent of non-marital births in that city. Please see Reichman et al. (2001) for further details on the sampling strategy.[118]

Participants

Mothers were eligible if they were 18 years or older (in one-third of the hospitals, though, this restriction did not apply and some women under 18 were interviewed), spoke English or Spanish, were not too ill to participate, reported that the father of their new baby was living, were not planning adoption for the baby and the baby did not die before the interview could take place.

The analyses for this aim were based on the national sample of women having a singleton birth and the fathers of the index baby. Couples were included in the analysis if they were in a relationship (reported that they were married, cohabiting or visiting), both the father and mother completed the survey and at least one outcome birth weight and/or gestational age data was available from the medical record abstraction (N=2,622 for birth weight and 2,637 for gestational age). Please see Figure II-1 below for the Data Selection Flow Chart. The data are representative of singleton births occurring in large (>200,000 people) U.S. cities.[118]

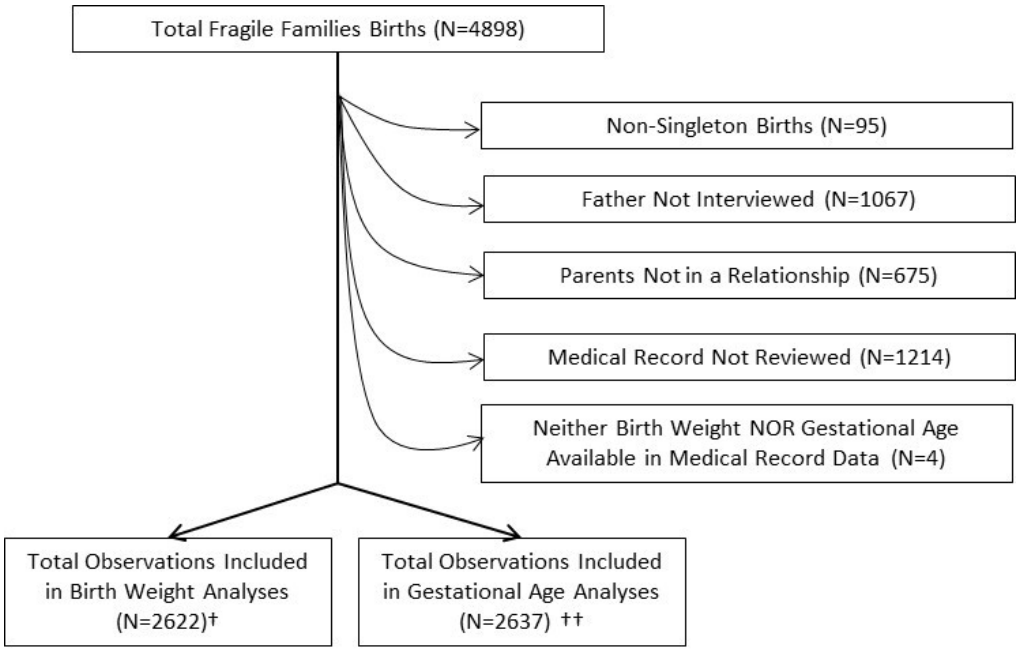

Figure II-1. Data Selection Flow Chart

† 2 of these cases did not have gestational age available †† 17 of these cases did not have birth weight available

Procedures

Parents completed baseline interviews in 75 hospitals or by phone in 20 cities across the U.S. generally within a few days of their child's birth. Mothers and 77% of fathers were interviewed within 7 days of the birth of their baby during the baseline wave of the study between the years of 1998 and 2000. Mothers were interviewed between 0 and 112 days after the birth, with 99% of the interviews

taking place within seven days of the birth. Fathers were interviewed between 0 and 381 days of the birth, with 77% of the interviews taking place within seven days of the birth.[119] Parents were asked by trained interviewers about their health, relationships, employment, finances, and environmental factors.[118]

Trained research staff abstracted birth outcome data from birth hospitalization records for mothers and the focal children. These data were available for 3,684 births. Data for the remaining 1214 births was not available because either 1) the hospital did not grant access to this data or there were too few cases to make it financially feasible (n=461, 38%), 2) the mother refused consent (n=401, 33%) or 3) the records could not be located in the hospital (n=352, 29%).[120] All procedures were approved by the Columbia University and the Princeton University Institutional Review Boards (IRBs), and by IRBs at the participating study hospitals.

b.2 Measures

Please see Appendix II-1 and Appendix II-2 for detailed item descriptions, and estimates on the validity and reliability of the measures used in the analyses for this chapter.

Predictors

All exposure variables were measured at the baseline survey, which occurred, in most cases, within a few days after the baby's birth. Four parent-reported summary measures of relationship quality were included in this analysis: 1) *positive couple activities, 2) couple conflict*, 3) *partner support* and 4) *relationship satisfaction*. Table II-1 shows a detailed description of the relationship quality predictor variables. Reports of positive couple activities and conflict referred to experiences over the previous month. Reports of partner support and relationship satisfaction referenced the current moment in time.

Additionally, two other indicators of relationship quality were included. *The baby's father's presence at the birth* was assessed by asking the baby's father whether he was present at the birth (Yes/No). *Relationship duration* was also assessed by asking women how many years and/or months they knew the baby's father before this pregnancy began.

Table II-1. Descriptive Information about Relationship Quality Predictor Variables

Relationship Quality Predictor	**Measure**	**Description**	**Response Scale**	**Scoring**[a,b,c]
Positive Couple Activities	Original to Fragile Families	4 items asked whether they had done positive activities with baby's father/mother in the **last month** (e.g. visited with friends, helped each other solve a problem)	1=Yes 0=No	-Responses summed to form an index -Higher scores correspond to more positive activities (range: 0-4) (α=0.64 women (w), 0.60 men (m))
Couple Conflict	Adapted from National Survey of Family Health[121]	6 items assessed frequency of disagreements about specific topics in the **last month** (e.g. money, sex, being faithful)	1= never 2= sometimes 3= often	-Responses summed to form a continuous scale -Higher scores correspond to more disagreement/more conflict (range: 6-18) (α=0.65 w, 0.64 m)
Partner Support	Adapted from Multidimensional Support Scale (MDSS)[122,123] and Susan Loyd's Effects of Violence on Work and Family project.	4 items assessed frequency of supportive and destructive behavior toward respondent by the baby's father/mother (e.g., s/he is fair and willing to compromise, s/he insults or criticizes you or your ideas)	1= often 2= sometimes 3= never	-Responses summed to form a continuous scale -Supportive behaviors were reverse scored. -Higher scores correspond to more partner support (range: 4-12) (α=0.60w, 0.59 m)
Relationship Satisfaction	Original to Fragile Families	6 items ask how life might be different if they were married to the baby's father/mother (for unmarried) or not married to the baby's father/mother (for married) (e.g. financial security, happiness)	4-point scale ranging from 5=much worse to 1=much better	-Responses summed to form a continuous scale -Responses from unmarried respondents were reverse scored. -Higher scores correspond to more partner/relationship satisfaction (range: 6-30) (α=0.72 w,0 .67m)
Baby's Father present at birth	--	Asked baby's father whether he was present at the birth	1=Yes 0=No	Dichotomous
Relationship Duration	--	Asked mothers years and/or months they knew the baby's father before the pregnancy	Months	Continuous (range: 0-432)

[a]Chonbach's Alpha (α) were conducted for all variables except a Kuder Richardson (KR-20) test of internal consistency was conducted for positive couple activities. [b]All internal consistency estimates are from this dataset.

[c]"w" stands for estimates among women and "m" stands for estimates among men

Outcomes

The baby's *gestational age at delivery* and *birth weight* were ascertained from the mother's medical record at the birth hospitalization. Gestational age was recorded in weeks and birth weight was recorded in grams.

Covariates

Several confounders were accounted for during model building and are described in detail in Appendix II-1. Demographic confounders included maternal household income,[2] both maternal and paternal age, education and race/ethnicity, and maternal parity, marital status and whether she paid with Medicaid or was otherwise uninsured at the time of delivery.

Other maternal clinical/health confounders included a history of mental health problems before pregnancy, prenatal care, gestational diabetes, pre-eclampsia or eclampsia, obesity during pregnancy, child gender and HIV/STI positive during pregnancy. Due to the low prevalence of HIV in the population, HIV and STIs were combined into one variable to strengthen the model and avoid large confidence limits.

These measures were abstracted from the mother's medical record.

Maternal use of drugs, alcohol and cigarettes during pregnancy (all yes/no) were also accounted for. These measures were abstracted from the mother's medical record.

[2] The question asked both parents, "Thinking about your income and the income of everyone else who lives with you, what was your total household income before taxes in the past 12 months?" Data was collected in categorical form from the respondent and then they were given the mean value for that category. However, about 25% of data was missing. For married and cohabiting couples, the mother's report was used if available, and the father's report was used otherwise. If household income was missing for both parents, the income was imputed using Stata's regression-based impute command. Because this variable is therefore a combination of maternal and paternal reports, only the maternal variable was included in statistical models. Please see "Introduction to the Fragile Families Public Use Data" (2008)[119] for details on the construction of this variable.

Since many of these covariates could also be considered on the pathway between relationship quality and birth outcomes, analyses accounted for the variables in blocks, sequentially. Please see *regression model building* in the Statistical Analysis section below.

Effect Measure Modifier

Marital status (yes/no) was treated as an effect measure modifier with the hypothesis that relationship quality would have a different effect on birth outcomes among married and unmarried couples.

Clustering and Weighting Variables

Due to the sampling procedures described above, descriptive statistics were run using city weights, making the estimates representative of births in the mother's city in the year of the interview.[124] Reliability estimates, correlations and t-tests were not run using any weighting or cluster variables. All regression analyses accounted for city and hospital variables by including these terms in the cluster statement within the SAS procsurvey command instead of using the city weights. Because mothers' and fathers' responses were included within the same model, a variable identifying the couple (ffchid) was also included in the cluster statement. Because unmarried births were oversampled, all analytical models controlled for marital status (coded 0/1) within the regression equation.

b.3 Statistical Analysis

Descriptive Statistics

Descriptive statistics were produced using SAS 9.3 proc freq and proc means commands with city weights applied. All remaining analyses used SAS 9.3 procsurvey commands and accounted for clustering by couple, and marital status, city and hospital due to the sampling scheme. Because the

sampling weights were not a function of the outcomes, unweighted regression estimates that controlled for the clustering variables were preferred because they are less biased, consistent and have smaller standard errors.[125] Procsurvey commands create robust standard errors and therefore the estimates are robust against non-normality.

Reliability estimates were calculated for the relationship quality predictor variables separately among mothers and fathers, and were sufficient for research purposes (Table II-1).

The amount of correlation between the mother's and father's report of the relationship quality predictor variables was also assessed (Table II-2). With the exception of relationship satisfaction, there was a moderate amount of correlation between the predictor variable responses (except a low amount of correlation between reports of relationship satisfaction)[126] among mothers and fathers within couples. Correlation coefficient values corrected for attenuation (by the variable reliability estimates) were also calculated in order to evaluate how highly correlated the scales would be if they were measured without error (Table II-2, columns 3, 5 and 7). These values were calculated for the entire population of interest (columns 2,3), for married (columns 4,5) and unmarried couples (columns 6,7), and for mothers and fathers interviewed within one month of each other (columns 8,9) and not (columns 10,11).

The fact that the corrected coefficients in all cases were higher demonstrates that the correlation of mother and father reports could be even greater if the reliability of the variables were greater. Only positive couple activities reached a fairly high level of correlation (.72) indicating that about half of the variation in scores is shared within couples. Nevertheless, some of the variance in scores is not shared, allowing the assessment of the contribution of each partner's reports of the relationship quality predictor variables. Therefore, all regression models that include both mother's and father's reports account for clustering by couple by including the couple identifier within the cluster statement of the SAS procsurvey command.

To compare the maternal and paternal relationship quality predictor variables, I also ran paired t-tests using the proc surveymeans command as described in Scerbo and Lajiness (2015)[127] to employ the city weights and control for marital status.

I also ran bivariate linear regression models between each predictor variable and each outcome separately using SAS proc surveyreg and employing city weights and controlling for marital status.

Table II-2. Pearson Correlations and Correlations Corrected for Attenuation between maternal and paternal reports of relationship quality among the subpopulation of interest.

	Total		Married		Unmarried		Interviewed within 1 month		Not Interviewed within 1 month

Regression Model Building

Initially, generalized estimating equations (GEE) were employed to account for the correlated nature of the couple reports and, therefore, clustering by couple. Generalized estimating equations can help parcel out the association of each parent's report with the birth outcomes. GEE produces population average estimates of the association of the predictor on the outcomes and accounts for clustering of data within couples.[128] GEE analyses, however, are not particularly amenable to handling

multiple clustering variables. Due to the sampling structure, the analyses needed to account for multiple levels of clustering, including couple, city, hospital and marital status. Therefore, the analyses were also conducted using a random effects model, while accounting for all of the clustering variables. As expected, the effect estimates were the same when employing a random effects model accounting for the clustering variables and GEE. The confidence intervals for estimates created using GEE were only slightly tighter than those of the effects model and the results were substantively the same. Therefore, I present the results from random effects models that account for all clustering variables, which are in effect, more conservative than the GEE models.

To start model building, bivariate associations were examined between each exposure variable (mother and father reports included simultaneously) and each birth outcome separately (birth weight and gestational age) while controlling for marital status.

Next, multivariate linear regression models were tested between all exposure variables and each birth outcome separately, including both mothers' and fathers' reports simultaneously within the models. Covariates were added in blocks in progressively more complex models. Model a included all maternal and paternal relationship quality predictor variables and controlled for marital status. Model b added other maternal and paternal demographic variables. Model c added maternal clinical health variables. Model d added maternal drug use during pregnancy variables.

To ensure that the time difference between the interviews did not have an unexpected effect on the estimates, model d was also run accounting for the time difference between parental interviews (within 1 month of each other vs. not). This variable was not significantly associated with either birth outcome in multivariate models, and the effect sizes and significance testing were not substantively changed with the addition of this variable. All models therefore exclude the time difference between parental interviews variable.

Exploration of the Interaction of Mother's and Father's Relationship Quality Reports

Next, I explored whether maternal and paternal reports had an interactive association with the birth outcomes. I hypothesized that the effect of a negative paternal report of relationship quality would be buffered by the effect of a positive maternal report of relationship quality. I also hypothesized that the greatest negative effect on birth outcomes would be when both parents reported a negative perception of their relationship. Models assessed the statistical interaction between maternal and paternal reports of the relationship quality variables conditioned on the same variables included in the full models (model d).

When there was a significant interaction between maternal and paternal reports on a relationship quality predictor variable (P<.05) I analyzed the effect of maternal report of the relationship quality variable at three levels of paternal report of the relationship quality variables. For example, I explored the estimates of the effect of maternal report of couple conflict on birth weight when the father's report was -1 SD, +1 SD and at the mean of father's report of couple conflict.

First, I plotted the association of the maternal report of a relationship quality predictor with the outcome (birth weight or gestational age) controlling for all covariates at 3 levels of the paternal reports (low: 1 SD below the mean; medium: the mean; high: 1 SD above the mean). Second, I assessed whether the effects of maternal report (controlling for all covariates) at the three levels of the paternal report were significant according to Aiken and West (1991).[129]

Effect Measure Modification by Marital Status

To determine whether the association between relationship quality and birth outcomes differed by marital status, I tested for 2-way interactions between marital status and relationship quality by including interaction terms (e.g. marital status*relationship quality variable for mothers and fathers) in multivariate logistic regression models using the Wald test for product term (a p-value of <0.05

indicating significant interaction). When a significant interaction (P<0.05) was present between a relationship quality predictor variable and marital status, plots were created of the association between the continuous predictor and the birth outcome by marital status. The significance levels of the simple slopes of the regression lines for married and unmarried respondents were determined.

c. Results

c.1 Descriptive Statistics

Demographics

Table II-3 describes the characteristics of the parents included in the sample for this analysis when employing the city weights. The mean birth weight was 3,328.4 grams (95% CI 3268.8, 3387.9) and the mean gestational age at birth was 38.6 weeks (95% CI 38.4, 38.9). The average age of women and men was 27.0 (95% CI 26.3, 27.6) and 29.7 (95% CI 29.1, 30.4), respectively, and 58.5% of parents were married. Women's and men's mean reported household income were just over $43,000. Over half of the participants had a high school degree/equivalent or less education. Most participants were black (30.1% women; 31.9% men) or Hispanic (32.6% women; 37.3% men). Most parents (84.7%) were interviewed within one month of each other.

Behavioral and Clinical Covariates

Cigarette use was somewhat common during pregnancy, with 13.3% of women having smoked at some point during their pregnancy. 8.0% of women had a pre-pregnancy diagnosis of a mental health problem. The vast majority of women started their prenatal care within the first three months of pregnancy (79.0%). Over half of the women received federal or other assistance to pay for the hospital costs associated with their delivery (54.2%). Nearly 12% of women had a sexually transmitted infection (STI) or HIV during their pregnancy.

Table II-3. Descriptive statistics (weighted) for subpopulation used in all analyses (singleton births, parents in a relationship, both the father and mother completed the survey and either or both birth weight and/or gestational age data was available from the medical record abstraction).[3]

Relationship Quality Predictors

On average, mothers and fathers reported engaging in three out of four *positive activities* with each other in the previous month. The most common activity reported was helping each other solve a problem (91.4% of mothers and 91.2% of fathers) and the least common activity was going to a movie (66.1% of mothers and 64.0% of fathers).

The most common topic of *couple conflict* was money, with 54.6% of mothers and 51.5% of fathers reporting sometimes or often disagreeing about money in the last month. The second most common topic of conflict was spending time together, with 44.9% of mothers and 46.2% of fathers reporting sometimes or often disagreeing about spending time together in the last month. The least common topic was conflict about drug or alcohol use, with 9.5% of mothers and 10.8% of fathers reporting sometimes or often disagreeing about drug or alcohol use in the last month.

Nineteen percent of mothers and 15.9% percent of fathers reported low *satisfaction with their relationship* (response one standard deviation below the mean or lower). Twenty percent of mothers and 21% of fathers report low *partner support* (response one standard deviation below the mean or lower).

Because one of the aims of the research is to compare effects by marital status, the characteristics of the sample among unmarried and married parents (unweighted) are presented in Table II-4 (mothers) and Table II-5 (fathers). Married couples had babies that were heavier at birth (3,365.8g vs. 3,203.1g) and had a slightly longer gestation (38.8 vs. 38.5 weeks) compared to unmarried couples. Married couples also generally reported more positive responses to the relationship quality variables and fewer clinical health risk factors.

Table II-7 shows the correlation matrix between the relationship quality variables among mothers and fathers separately. The highest correlation between variables for both men and women was between couple conflict and partner support (r=-0.42, P<.001 mothers; r=-.03, P<.001 fathers). The higher the conflict reported, the lower the parents' report of their partner's support.

Table II-7. Pearson Correlation matrix of relationship quality variables for mothers and fathers (unweighted).

Table II-8 shows that among fathers, couple conflict, activities and his presence at birth were significantly associated with both birth weight and the latter two variables were associated with gestational age. Among mothers, however, none of the relationship quality predictor variables were associated with the birth outcomes. Most of the covariates were significantly correlated with both birth outcomes.

Table II-8. Bivariate linear regressions of predictor variables and covariates with birth weight in grams and gestational age in weeks conducted separately among mothers and fathers employing city weight and controlling for marital status.

c.2 Linear Regression with Birth Weight and Gestational Age

Relationship Quality and Birth Weight

Base models run separately for each relationship quality predictor variable, but that included both maternal and paternal reports and controlled for couple, city, hospital and marital status, showed that greater paternal report of conflict in the previous month was significantly associated with lower birth weight (B=-15.63 grams; 95% CI -26.28,-4.98)(Table II-9).

Results also showed that babies born to fathers who were present at the birth were on average 125.5 grams (95% CI 59.0, 192.0) heavier than babies born to fathers who were not present at birth. No other maternal or paternal reports of relationship quality predictor variables were significantly associated with birth weight in crude models. As a point of reference, recent studies have estimated that babies born to light smokers during pregnancy are on average 160 grams lighter at birth than

babies born to non-smokers.[130] In this study, the full regression model shows that babies born to smokers were also, on average, 162.60 grams lighter than babies born to non-smokers (Table II-11).

Table II-9. Bivariate linear regression models for birth weight. Models a-f were run separately for each relationship quality predictor variable, with both mother's and father's reports within the same model.

** P<0.01; ***P<0.001

Relationship Quality and Gestational Age

In base models with gestational age as the outcome that included both maternal and paternal reports, the only relationship quality predictor variable that was significantly associated with gestational age at birth was the baby's father's presence at the birth (Table II-10). Babies born to fathers who were present at the birth were born, on average, 0.61 weeks (4.27 days) later than babies whose father was

not present at the birth (B=0.61; 95% CI 0.34, 0.88). As a point of reference, in this study, the full regression model (model d) shows that babies born to non-smokers were, on average, born nearly 1 day later than smokers (Table II-12).

Table II-10. Bivariate linear regression models for gestational age. Models a-f were run separately for each relationship quality predictor variable, with both mother's and father's reports within the same model.

c.3 Multivariate Linear Regression with Birth Weight and Gestational Age

Relationship Quality and Birth Weight

Multivariate models that included all of the maternal and paternal reports of the relationship quality predictor variables, and added confounders in a hierarchical fashion showed results similar to

the results described above in the simpler base models (Table II-11, models a-d). In the final model (model d), which included all covariates, father's presence at the birth (B= 98.81, 95% CI 21.58, 176.04) was significantly associated with birth weight when controlling for marital status, city, hospital, couple, maternal and paternal demographics, maternal clinical health and maternal substance use during pregnancy (Table II-11, model d). The coefficient for father's presence at birth was reduced by 32.19 grams once all variables were added to the model, but remained statistically significant. This suggests that the confounders and the potential mediators (e.g. smoking) account for much, but not all of the association of the father's presence at birth with birth weight. With the addition of maternal substance use during pregnancy (models c to d), which could also be considered mediators as substance use may result from high levels of stress, the coefficient of the effect of father's presence at the birth changed by 0.20 grams, or 0.2%.

Paternal report of conflict remained marginally significantly associated with birth weight (B=11.54; 95% CI -23.54, 0.47) in the final model accounting for maternal and paternal demographics, maternal clinical/health and maternal substance use during pregnancy. With the addition of maternal substance use during pregnancy (models c to d), the coefficient of paternal report of conflict became marginally significant, but was reduced by only 0.91 grams, or 7%. Thus, it is unlikely that maternal substance use during pregnancy was a strong mediator in this analysis.

Relationship Quality and Gestational Age

In multivariate models, paternal report of conflict (B= -0.05; 95% CI 0.11,-0.002) and father's presence at the birth (B= 0.51; 95% CI 0.19, 0.83) were significantly associated with gestational age at birth when controlling for all covariates (Table II-12, model d). The coefficient for father's report of conflict remained virtually unchanged with the addition of control variables (from -0.06 in model a to

-0.05 in model d), suggesting that neither the confounders nor the potential mediators account for the association between father's report of conflict and gestational age at birth.

The coefficient for the father's presence at the birth was reduced the most with the addition of maternal and paternal demographic variables (from 0.63 in model a to 0.56 in model b) and only slightly reduced with the addition of maternal clinical health indicators and pregnancy substance use (0.51 in model d). The addition of maternal substance use during pregnancy (model c to d) did not change the coefficient of the association of the father's presence at birth with gestational age. Thus, it is unlikely that maternal substance use during pregnancy was a strong mediator in this analysis.

d.4 Interaction of Parental Reports

There were significant interactions between maternal and paternal reports of couple conflict in the association with birth weight (P=.01). No other interaction terms were significant at the P<0.05 level.

As shown in Figure II-2, I further explored the association between paternal reports of couple conflict with birth weight at three levels of maternal report of couple conflict controlling for all variables in the full model (model d): low: 1 SD below the mean; medium: the mean; high: 1 SD above the mean using Aiken and West (1991) as a guide.[129]

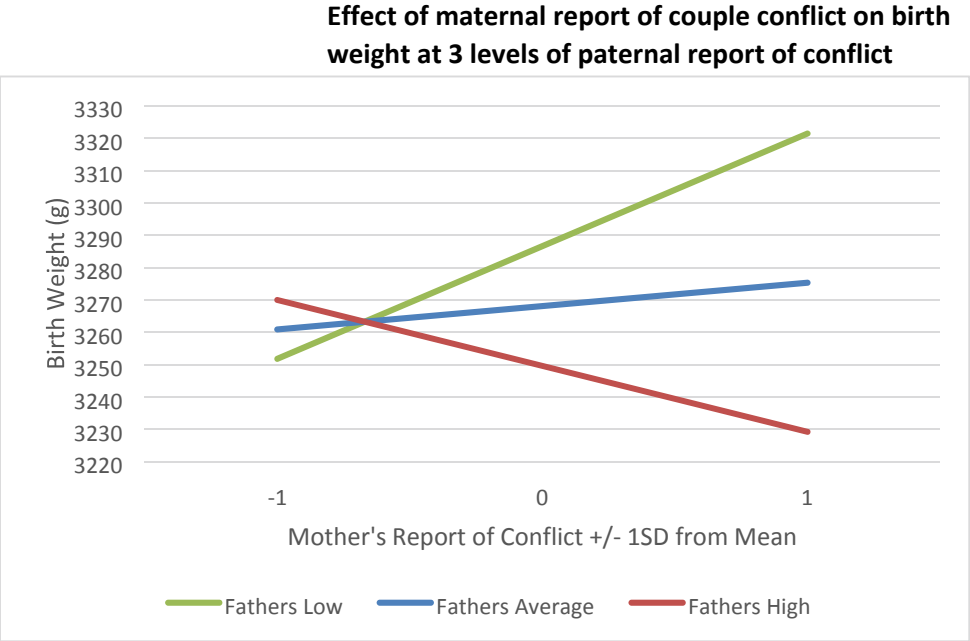

Figure II-2. Association between maternal report of couple conflict and birth weight at three levels of paternal report of couple conflict: low: 1 SD below the mean; medium: the mean; high: 1 SD above the mean.

d.5 Effect Measure Modification by Marital Status

There was a significant interaction between paternal report of couple conflict and marital status in the association with birth weight (B=27.27, 95% CI 1.08, 53.46, P=.04). When looking at simple slopes, among unmarried fathers, those who reported greater couple conflict had babies with lower birth weight on average (B=-14.92, 95% CI -28.24, -1.61, P=.03). The association between paternal report of couple conflict and birth weight was not significant among married fathers (Figure II-3).

To explore whether the association of paternal report of conflict with birth weight among unmarried men was driven by unmarried men reporting higher average levels of conflict, I added the interaction term between marital status and father's report of conflict into the interaction model with maternal and paternal report of couple conflict (section d.4). The interaction between maternal and paternal report of couple conflict remained significant, the effect size did not change substantially and the interaction between paternal report of conflict and marital status was not significant. This result suggests that the association between paternal report of conflict and birth weight is not driven by unmarried men reporting higher average conflict.

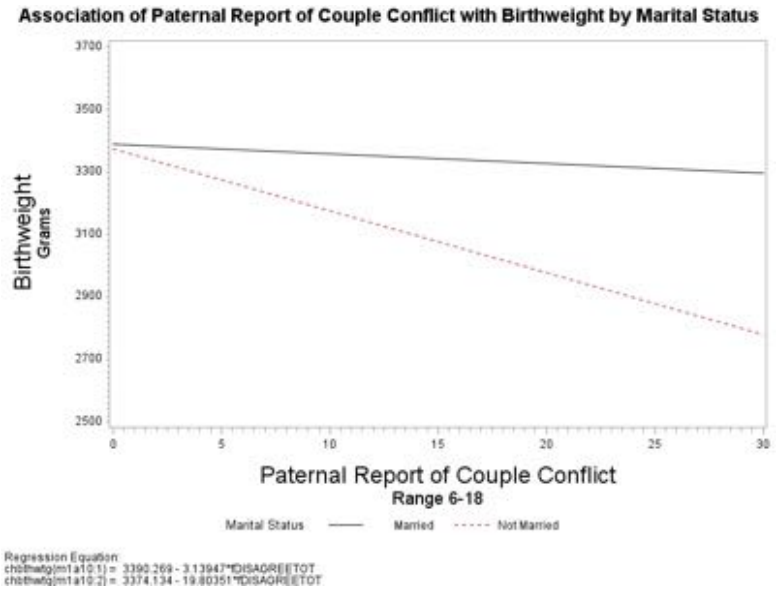

Figure II-3. Effect measure modification of the association between paternal report of couple conflict and birth weight by marital status.

The interactions between marital status and maternal and paternal reports of conflict in the association with gestational age were not significant.

There was a significant interaction between relationship duration and marital status in the association with birth weight (B=-1.07, 95% CI -2.10, -0.04, P=.04). When looking at simple slopes, among unmarried couples, those who reported greater relationship duration had babies with greater birth weight on average (B=0.75, 95% CI .08, 1.42, P=0.03). The association between relationship duration and birth weight was not significant among married couples (Figure II-4).

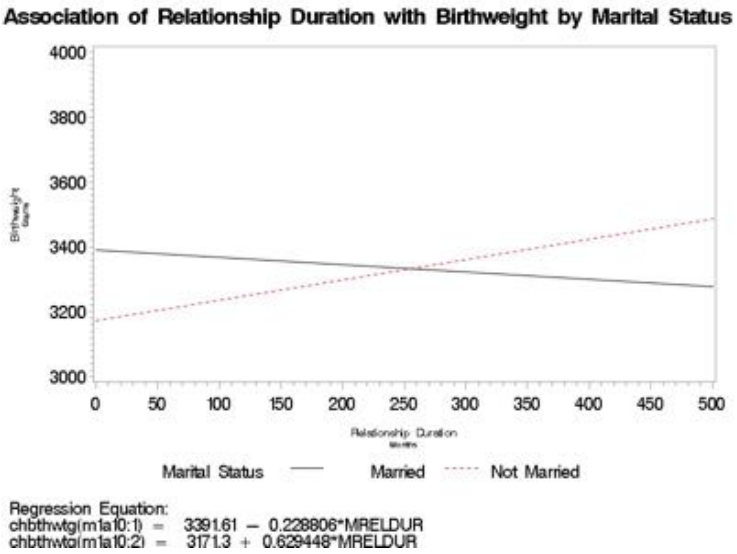

Figure II-4. Effect measure modification of the association relationship duration and birth weight by marital status.

Marital status did not interact significantly with any other relationship quality predictor variables when predicting birth weight.

Marital status did not interact significantly with any relationship quality variables when predicting gestational age at birth.

d. Discussion

Among this national sample of married and unmarried parents in a relationship, the father's report of conflict with his partner over the previous month and the father's presence at birth were both significantly associated with having a baby with a lower birth weight and an earlier gestational age at birth after controlling for maternal and paternal demographic factors, maternal pregnancy clinical health and maternal substance use during pregnancy. The effect sizes of findings were substantial. Babies born to fathers who fell into the highest quartile of conflict were 69.68 grams lighter than babies born to fathers who fell into the lowest quartile of conflict after controlling for all covariates. Additionally, babies born to fathers who were not present at the birth were nearly 99 grams lighter after controlling for all covariates. Estimates show that babies born to *light* smokers during pregnancy are on average 160 grams lighter at birth than babies born to non-smokers. Therefore, these effect sizes are not neglegible.[130]

Conflict in a relationship and the association with birth outcomes

Conflict in a romantic relationship can cause serious stress among both members of an expectant couple and the evidence from this study supports the hypothesis that this conflict can have a deleterious effect on two important birth outcomes: birth weight and gestational age. A plethora of studies have shown that women's experiences of stress during pregnancy are associated with PTB[27,28,31–33] and LBW.[27,31,34,35] The findings from the current research show that men's experiences of conflict within a relationship have a significant association with negative birth outcomes, suggesting that men's experiences and feelings when they are expecting a baby may have a unique contribution to birth outcomes.

Recent evidence has demonstrated that elevated levels of stress hormones, such as cortisol, among pregnant women are associated with lower birth weight[131] and lower gestational age at birth.[132]

A recent study by Feinberg and colleagues (2013), however, showed that salivary cortisol levels were elevated among both partners in an expecting couple in response to conflict within their relationship. Emotional contagion research has shown that feelings and emotions among members of a romantic couple tend to spill-over from one member of the couple to the other.[133] Thus, men's and women's stress reactions may converge and ultimately have an interactive effect on birth outcomes. Consistent with this research, the results of the interaction between maternal and paternal reports of conflict suggest that the average birth weight was the lowest when both parents reported high levels of conflict with their partner. Further, the results suggest that the mother's report of conflict is protective--when mothers perceived low levels of conflict, the father's report of conflict did not have an association with birth weight; however, when mothers reported high levels of conflict, the greater the father's the report of conflict the worse it was for the baby.

Differences in the association of relationship quality with birth outcomes by marital status

Many studies have demonstrated that babies born to married parents, on average, have greater birth weight and a longer gestation compared to babies born to unmarried parents.[66] We know little, however, beyond associated socioeconomic status, about what about being unmarried or married affects birth outcomes. The results from this study show that paternal reports of conflict were only significantly predictive of lower birth weight among *unmarried* fathers. This finding is consistent with previous qualitative research showing that married and unmarried couples perceive tensions in their relationship differently. Waller (2008) found that unmarried couples felt tensions were a greater risk to the stability of their relationship.[107] Conflict in a relationship is a fact of life; however, the results of this study may suggest that couple conflict may cause more stress among unmarried couples than married couples, and therefore have a more negative association with birth outcomes among unmarried couples.

In addition, relationship duration was only predictive of greater birth weight among *unmarried* couples in this study. It is possible that being married is a useful indicator of a committed relationship with more resources to support a healthy pregnancy; however the story is more nuanced among unmarried couples where the duration of the relationship may matter more. This finding may suggest that among unmarried couples, those who have been in a relationship longer may have developed healthier relationships (e.g. better ways to deal with conflict) that can support a healthier pregnancy than unmarried couples who have known each other for a shorter period of time.

The association of the baby's father's presence at birth with birth outcomes

In the current study, the baby's father's presence at the birth was significantly associated with both the baby's birth weight and gestational age at birth among married and unmarried couples alike. In fact, the magnitude of the association with birth weight is similar to the effect of light smoking during pregnancy on birth weight.[130] Whether the baby's father was present at the birth may be a useful way to discern between pregnancies that are more at risk for negative birth outcomes (and potentially poor child health outcomes later). The baby's father's presence at the birth may be a marker of the father's involvement and support, both material and emotional, during the pregnancy. As theorized by Alio et al (2010), support from the baby's father during pregnancy may decrease maternal stress and encourage healthy behaviors, ultimately leading to better birth outcomes.[68]

A study by Teitler (2001) among unmarried couples only within the Fragile Families study, however, did not find that the father's presence at the hospital for the baby's birth or visited around that time was associated with the risk for low birth weight.[103] Teitler (2001) did find that the father's presence at the birth had a positive association with maternal health behaviors, however.[103] Thus, this study is unique in that it found a significant association between the baby's father's presence at the birth and both birth weight and gestational age among the Fragile Families population after controlling

for maternal and paternal demographics, and maternal clinical health and substance use during pregnancy. The differences between Teitler's (2001) findings and the findings in this study are likely due to the fact that 1) Teitler's analysis only included unmarried couples, while this analysis uses all couples in a relationship; 2) Teitler used a dichotomous measure of low birth weight, while this study looked at the continuous forms of birth weight and gestational age abstracted from the medical record and 3) Teitler used the mother's report of whether the father was present at the birth, whereas this study uses the father's report of his own actions (though Teitler reports that the results were substantively the same using father report).

Limitations

While this study has many strengths, it is not without limitations. This secondary data analysis is limited by the study design and the measures collected. The timing of assessments is of some concern. Parents' report of their relationship quality was assessed shortly after the birth of their baby, raising concern over the issue of reverse causality. It is possible, though unlikely, that having a child born with a low birth weight or too early could cause parents to reflect more negatively about their relationship with their partner due to the stress that they are under. In addition, the fathers and mothers were not always interviewed on the same day, thus their perspectives on their relationship may differ due to the elapsed time and events that may have occurred within this time, rather than true differences in how they perceived their relationship quality. A sensitivity analysis was conducted comparing the results among couples that were interviewed within one month of each other versus the more than one week, and the results among the two groups were substantively the same.

As with all observational studies, there could be important omitted confounders that could explain the relationship between relationship quality factors and the birth outcomes. Unfortunately, due the limitations of the study design and measures collected, we cannot parcel out unmeasured

confounding of the association between relationship quality and birth outcomes by some other parental characteristic (e.g. personality, depression) that would affect both the exposure and outcome. Future studies would be strengthened by abstracting birth outcomes from medical records, measuring reports of relationship quality at multiple time points during pregnancy, and measuring other personality and affect variables during pregnancy. This study would also be strengthened by the inclusion of a partner support variable that had higher reliability,

Strengths

Despite these limitations, this study provides an expanded and more comprehensive assessment of relationship quality and its association with birth outcomes compared to previous studies which have been limited to assessing paternal social support, markers of paternal involvement (e.g. father's name on birth certificate, paternal financial contributions) and intimate partner violence.[68,71,103,134] The addition of a single-item maternal report of being a victim of physical abuse by the baby's father was added to the full models assessing the associations between all relationship quality predictors and each birth outcome; however the effect estimates were unchanged.

This study also included direct report of relationship quality from the fathers, while most studies use reports only from mothers, and included both maternal and paternal reports within the same statistical model while accounting for clustering by couple. This study was thereby able to show that men's experiences and feelings when they are expecting a baby may have a unique contribution to poor birth outcomes—something that no other study has done.

Implications for Future Research and practice

This study suggests that dimensions of relationship quality, and most saliently couple conflict and the baby's father's absence at the birth, are associated with birth outcomes at a level that is nearly commensurate with the effect of light smoking on birth outcomes. Further, in this study, men's report of his experiences of conflict were associated with birth outcomes while the mother's reports acted only in concert with her partner's report. Our nation has spent the last several decades focusing on changing maternal behaviors (e.g. smoking during pregnancy and attending prenatal care) to improve population rates of low birth weight and preterm birth with little luck. Programs and policies that not only address the importance of healthy romantic relationships, but that also include both members of an expectant couple, may help support healthier pregnancies and improve the rates of negative birth outcomes.

Chapter III. Parental Stress during Pregnancy and Birth Outcomes among Children in the Parenting and Relationship Transition and Risk Study

a. Introduction

Preterm birth (PTB; <37 weeks gestation) and low birth weight (LBW; <2,500 grams) are leading causes of infant mortality in the United States (U.S.)[110] and infants born pre-term and/or with a LBW are at increased risk for negative health and developmental issues as they grow.[111,112] Of all infants born in the U.S., 11.3% are born preterm and 8.0% are born with a low birth weight.[39] Among teens aged 15-

19, the rates of PTB and LBW are even higher at 13.0% and 9.3% respectively.[39] Among babies born to 15 year olds, 17.3% are born preterm and 10.2% have a low birth weight.[39] The higher rates of these adverse birth outcomes among teens has been attributed to maternal risk factors associated with teenage pregnancy, such as low socioeconomic status, minority status, and inadequate prenatal care.[135,136] A retrospective cohort study of 3,886,364 pregnant women comparing teens to adults, however, found that teen pregnancy increases the risk for adverse birth outcomes even after adjusting for these factors,[137] suggesting that other factors are also at play.

Stress as a predictor of birth outcomes

Epidemiological evidence shows that maternal stress during pregnancy is consistently predictive of negative birth outcomes, including PTB[27,31–33,138]and LBW. [27,31,34,35] In fact, the American Congress of Obstetricians and Gynecologists recommends screening for psychosocial stress as part of prenatal care, citing that it may play a role in PTB and LBW.[37] Adolescents and young adults experience stressors that emanate from various life domains, including close relationships and personal hardships, but for adolescents and young adults who are racial and/or ethnic minorities and from a low socioeconomic status (SES), daily stressors often extend beyond these typical developmental challenges. This population is disproportionately affected by other chronic stressors, such as neighborhood problems (e.g. crime, poor infrastructure), racism and discrimination.[38] Thus, stress may have a substantial effect on birth outcomes among low SES youth of color.

Conceptually, stress is an interactive process in which environmental demands exceed one's adaptive capacity, resulting in three types of responses that can lead to poor health outcomes and, therefore, serve as mediators between experiences of stress and adverse birth outcomes: 1) behavioral, 2) cognitive/psychological and 3) physiological responses.[40,41,139] Experiences of stress are hypothesized

to affect birth outcomes through these three inter-related stress-response processes, as detailed below.[44]

First, negative health behaviors, such as smoking or substance use, can serve as coping mechanisms for stress. [41,140] Studies show that stress consistently predicts negative health behaviors (e.g. smoking, substance use, poor dietary habits, physical inactivity) among pregnant women, [46,139] which are also consistently related to adverse birth outcomes. For example, smoking and substance use are well-documented causes of PTB,[19] and inadequate nutrition and smoking are known risk factors for LBW.[20,139]

Second, negative appraisals or perceptions of stress are thought to cause cognitive and psychological responses, which subsequently directly affect both behavioral and physiologic responses, and risk for physical and mental disease.[40,51] These psychological responses include depressive symptoms, which have been independently linked with negative birth outcomes.[51]

Third, two physiologic pathways through which stress and the cognitive and psychological responses may affect birth outcomes include the neuroendocrine system—specifically the hypothalamic-pituitary-axis (HPA), which regulates the physiological response—and the immune/inflammation system. Under conditions of chronic psychological stress, the HPA axis can become dysregulated, leading to chronically elevated levels of glucocorticoids in the system,[138] which could signal a series of endocrine events leading to PTB.[138] Stress may cause preterm birth through the immune/inflammation pathway by increasing maternal susceptibility to infection,[27] causing the release of catecholamines[27] or causing an inflammatory response that triggers contractions, cervical ripening and membrane rupture.[29]

Dunkel Schetter and Lobel[139] offer the most comprehensive framework depicting the pathways through which maternal stress may influence PTB and LBW (Figure III-1). The conceptual model

describes how both chronic (persistent or recurrent difficulties over the long term) and acute (discrete threats that are shorter term) stressors can influence birth weight and gestational age at delivery. Dunkel Schetter and Lobel's framework synthesizes findings from a large literature examining individual stress components and birth outcomes. Previous studies, however, have been inconsistent in terms of how stress is conceptualized,[78] if a conceptual model is attended to at all, and none assess all components of this model, including stress exposures, appraisal, responses and birth outcomes.

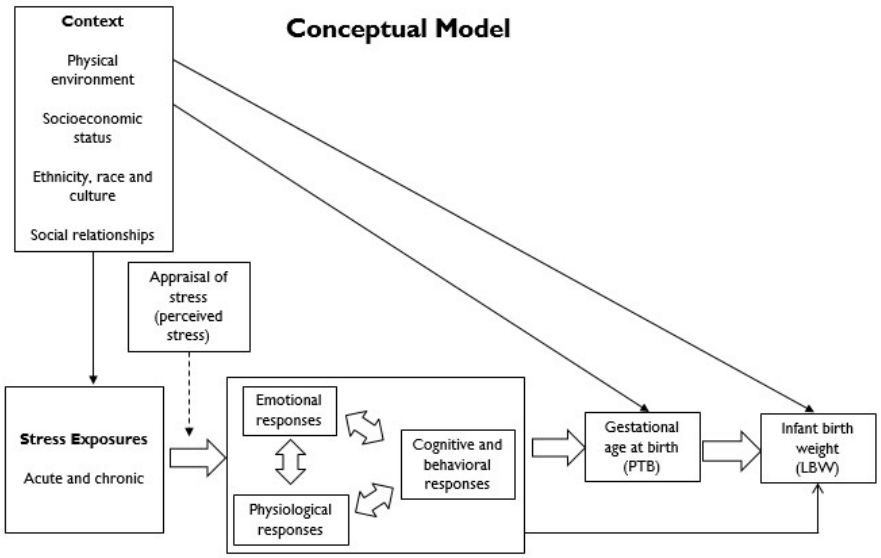

Figure III-1. Conceptual model of stress and birth outcomes. Reproduced from Pregnancy and Birth Outcomes: A multilevel analysis of prenatal maternal stress and birth weight. In: *Handbook of Health Psychology (2nd Edition)* (p.451), by Dunkel-Schetter and Lobel, 2012, New York: Springer.[43]

Sources of stress

The stressors that expectant parents experience may come from multiple sources, including individual experiences (e.g. job loss), interpersonal exposures (e.g. conflict in a steady relationship), neighborhood conditions (e.g. crime in neighborhood), and societal context (e.g. racism). These stressors are common among low income populations and racial and ethnic minorities due to social and economic structures and influences.[141] These stressors could influence birth outcomes through the

behavioral, psychological and physiological pathways described above, and a large body of literature has examined how maternal experiences in each of these domains is associated with negative birth outcomes. For example, checklist inventories of acute major life events mothers experienced during pregnancy have been associated consistently with lower infant birth weight and gestational age at birth.[35,139] Maternal perception of neighborhood problems during pregnancy have been significantly associated with lower infant birth weight,[142] with the hypothesis that living in a disadvantaged neighborhood causes stress by increasing the likelihood of experiencing stressful life events and exposing individuals to neighborhood disorder.[143] Discrimination and racism are also thought to cause chronic stress; however, the findings on the effects of maternal experiences of discrimination on birth outcomes have been mixed. Some studies exploring whether maternal experiences of discrimination during pregnancy are associated with LBW and PTB have found a significant association (e.g. Dominguez et al.,[144] Collins et al.[145]), while others have not (e.g. Lu and Chen,[146] Shiono et al.[147]). Most studies have assessed the influence of these different sources of stressors on birth outcomes individually, despite acknowledgement that birth outcomes are the result of conjoint effects of multiple factors.[139]

Stress among expectant adolescents and young adults

While stress cuts across all populations, stress may have a larger deleterious effect on expectant adolescents and young adults for several reasons. First, adolescents and young adults are developing and may lack effective coping skills and resources. [94] Second, pregnancy itself can be a stressor for any expectant parent,[148] but the transition to parenthood may be exceptionally stressful for adolescents because they are concurrently confronting the challenges of parenthood and adolescent development.[149] Pregnancy can also give rise to or exacerbate other stressors that may be more common among adolescents and young adults compared to older expectant parents (e.g. financial concerns for supporting a new baby, relationship problems).[96] Third, during adolescence and young adulthood, social

relationships outside of the family, including romantic relationships, become increasingly important.[97] An adolescent's romantic partner plays an important role in the attachment, support, and caregiving behavioral systems.[98] Most expectant adolescents and young adults are involved with the baby's father during pregnancy;[65,150] however they are still learning to interact with their partner and developing their relationship skills[98] and therefore negotiating this relationship may be a significant source of stress for adolescents compared to older adults.

Paternal Influence on birth outcomes

A large body of literature has documented that women's experiences of stress during pregnancy are associated with negative birth outcomes;[27,31–34,138] however, research has also demonstrated that the perceptions of stress and coping strategies are affected by social relationships.[62] The relationship with the baby's father is often an important social relationship in an expectant woman's life, regardless of marital status. Over 80% of unmarried pregnant women are in a relationship with the baby's father during pregnancy.[63] Thus, a woman's male partner likely has a substantial influence on the expectant mother during this time.

Despite the importance of male partners during pregnancy, very little research has explored paternal influences on birth outcomes.[66] Research examining the impact of stress on birth outcomes that includes paternal factors has been limited to maternal reports of paternal involvement and support, and these measures are often crude (e.g. the extent to which there is a father's name on the birth

certificate).[68,71] Researchers and clinicians have almost entirely focused on how women's experiences are associated with birth outcomes; however, men's experiences of stress during his partner's pregnancy may also influence birth outcomes through his effects on maternal psychosocial factors.[67]

In fact, substantial evidence supports the theory that among couples, stress experienced by one member can affect the well-being of the other member. [72] For example, a woman's partner's stress with his friends may impact her own depression.[72] Much of this research has focused on the cross-over of one's work stress to the other's well-being[72] and relationship satisfaction (e.g. Neff[74]); however no studies have documented this process among expectant couples, and none have assessed the impact of paternal stress during pregnancy on birth outcomes via effects on maternal well-being.

Current Study

The current study aims to, first, investigate the association between maternal and paternal stress during pregnancy and the gestational age at birth and birth weight of their baby among adolescent and young adults from low SES. Second, this study aims to explore whether the associations of maternal and paternal experiences of stress with birth outcomes, if evident, are mediated by maternal depressive symptoms.

b. Methods

b.1 Data Source

Overview and Sampling Procedures

Data for this analysis come from baseline interviews of 296 expectant young couples who participated in the Parenting and Relationship Transition and Risk Study (PARTNRS) between 2007 and 2011, and their birth hospitalization medical records. Women were recruited from obstetrics and gynecology clinics and an ultrasound clinic in four university-affiliated hospitals in southern Connecticut. An initial screening included only women who reported they were in a romantic relationship with the baby's father.

If the baby's father was not present at the time of screening, research staff asked for permission to contact him to explain the study. If the expectant woman was willing, research staff provided

informational materials for the baby's father and asked the baby's mother to talk to him about the study. Research staff contacted the baby's father to answer any questions and, if he was interested, scheduled an appointment for the couple's baseline interview.

Participants

Inclusion criteria to participate in the baseline interview for both men and women were: (a) pregnant or partner was pregnant after 24 weeks gestation; (b) women were age 14-21 years and men were age ≥ 14; (c) both reported being in a romantic relationship with each other; (d) both reported being the biological parents of the unborn baby; (e) both agreed to participate in the study and (f) both were able to speak English and/or Spanish.

Study Procedures

A research staff member obtained Informed consent at the baseline appointment, which was conducted after 24 weeks gestation but before the baby was born. The couples separately completed a structured interview via audio computer assisted self-interviews (ACASI) during this baseline appointment. ACASI allows respondents to listen over headphones to spoken questions that are also displayed on the computer's screen.

After the baby's due date, a research assistant went to each affiliated hospital and collected birth outcome information from each participating woman's medical record. A small number of women did not deliver at an affiliated hospital.[4] In this case, the research assistant collected basic birth outcome information (e.g. birth weight, gestational age at delivery) directly from the baby's mother by calling her

[4] The number of cases where the birth outcome information was not abstracted from the mother's medical record, but rather from the mother's report, is unknown due to a lack of documentation in study records; however, it is estimated at less than 5%.

on the telephone. The Yale University Human Investigation Committee and the Institutional Review Boards (IRB) at study clinics approved all procedures. The CUNY Graduate Center granted IRB approval to use the de-identified PARTNRS data as well. Each participant (mothers and fathers separately) was paid $25 for his or her voluntary participation in this interview.

b.2 Measures

Please see Appendix III-1 and Appendix III-2 for detailed item descriptions, and estimates of the validity and reliability of the measures used in the analyses for this chapter. All measures for this aim were assessed among both mothers and fathers at the baseline interview during pregnancy (after 24 weeks gestation).

Assessment of stress

Table III-1 shows a detailed description of the relationship quality predictor variables. Three different stress measures were assessed via ACASI at the baseline interview and included in this analysis. Stressful life events over the previous six months were measured using a modified 11-item version of Brugha and Cragg's Life Events Scale (LES).[151] Participants reported whether they experienced each item (yes/no), such as suffering a serious injury or assault and having money problems. Experiences of discrimination (referring to experiences "in general") were measured using Essed's Daily Life Experiences Scale.[152] Participants responded on a 6-point scale ranging from "Never" to "Once a Week Or More" for each item, such as "In general, how often are you observed or followed while in public spaces?" and "In general, how often are you ignored, overlooked, or not given service (in a restaurant, store, etc.)?" Perceived stress over the past month was measured using ten items from Cohen's

Perceived Stress Scale.[88] Participants indicated how often they felt each item on a 5 point scale ranging from 0=”never” to 4=”very often,” such as “In the past month, how often have you felt unable to cope with all of the things you had to do?” and “how often have you felt that difficulties were piling up so high that you couldn’t overcome them?”

Assessment of Birth Outcomes

The baby’s birth weight and gestational age at delivery were abstracted from the mother’s medical record at delivery (or from the baby’s mother if not available as described under *Study Procedures*).

Gestational age was recorded in weeks and birth weight was recorded in grams.

Covariates

Several covariates were accounted for during model building and are described in detail in Appendix III-1. A priori hypothesized demographic confounders included maternal and paternal household income, age, work/student status, race/ethnicity, maternal parity and baby’s gender.

Clinical risk factors were also a priori hypothesized confounders. A summary score of five clinical risk factors ranging from 0 to 5 was computed due to the low numbers of women with any one factor. Women were given a value of 0=No and 1=Yes for each of the five clinical risk factors: obese before pregnancy (based on BMI >30 calculated from self-report of pre-pregnancy weight and height); positive Chlamydia and/or Gonorrhea test at any point during pregnancy (LCR test during study visit in the late second or early third trimester); medical record indication of pre-eclampsia; medical record indication of

gestational diabetes; and self-report on whether she received any prenatal care prior to the interview, which was within the third trimester.

Smoking and alcohol use during pregnancy were measured using an adapted, 7-item version of the Recreational Drug Use Scale.[153] Frequency of use during the past three months for both substances were assessed using a 5-point Likert scale, ranging from 0 = "Never" to 4 = "Every Day." This study dichotomized the responses to 0 = "Never" and 1 = "At least some."

Mediator

Depressive symptoms over the past week were measured using 15 of the 20 items in the Center of Epidemiological Studies-Depression Scale (CES-D).[91] Participants responded on a 4-item scale ranging from 0="Less than 1 day" to 3="5-7days". Items included "during the past week I had crying spells" and "during the past week I felt depressed." Responses were summed to form a continuous depressive symptom score ranging from 0 to 45.

Table III-1. Stress predictor and mediator variables

Construct	Measure	Description	Response Scale	Scoring
Stressful Life Events	Brugha and Cragg Life Events Scale (LES)[151] (adapted)	11 items assessed experiences of stress (e.g. having an illness, death in the family)	1=Yes, 0=No	-Responses summed to form an index -Higher scores correspond to more events (range: 0-11)
Discrimination	Essed Daily Life Experiences Scale[152] (adapted)	20 items assessed experiences of discrimination (e.g. not being given service in store, being called insulting name).	6-point scale ranging from 0 ("Never") to 5 ("Once a Week or More")	-Responses summed to form a continuous scale -Higher scores correspond to more discrimination (range: 0-100) (α = 0.92 w, 0.94 m)
Perceived Stress	Cohen Perceived Stress Scale[88]	10 items assessed degree situations are stressful (e.g. how often nervous or stressed; unable to control important things)	5-point scale ranging from 0 ("Never") to 4 ("Very often")	-Responses summed to form a continuous scale -Higher scores correspond to more perceived stress (range: 0-40) (α = 0.77 w, α = 0.74 m)
Depressive Symptoms	Center of Epidemiological Studies-Depression Scale (CES-D).[91] (adapted)	15 items assessed how often experienced the depressive feeling or thought (e.g. I felt depressed, had crying spells) -Five behavioral manifestations of depression items were removed	4-point scale ranging from 0 ("Rarely or none of the time (less than 1 day") to 3 ("Most of the time (5-7 days)")	-Responses summed to form a continuous scale -Higher scores correspond to more depressive symptoms (range: 0-45) (α = 0.77 w, α = 0.74 m)

b.3 Statistical Analysis

I generated descriptive statistics of sample characteristics using IBM SPSS Statistics V22 (IBM Corporation, Armonk, NY). I used IBM SPSS AMOS V22 to construct a latent stress measure from the three stress measures and complete all remaining analyses. I then used structural equation modeling (SEM) to test the extent to which the maternal and paternal latent stress variables predicted gestational age at birth and birth weight after adjusting for a priori hypothesized confounders. I further examined whether maternal depression explained any of the association between the latent stress variables and birth outcomes to test for it as a mediator. SEM simultaneously assesses direct, indirect and total effects of a system of variables on an outcome. It can be tailored to account for clustering of data within couples, can accommodate multiple correlated outcomes (such as birth weight and gestational age in this study) and can include latent variables.[154,155] Therefore, SEM was ideal for use in this study.

Sample

Of the 296 participants, seven men had substantial missing data (i.e. had at least one stress measure missing). Maternal and paternal demographic characteristics did not differ significantly among the men with missing data on the stress variables compared to those who were not missing data (not shown). Therefore, couples where men were missing stress data were excluded. Fourteen additional couples were missing data for birth weight and gestational age at delivery and another three were missing data on birth weight. Maternal and paternal demographic characteristics did not differ significantly between the couples missing birth outcomes data and those with this data (not shown). These 17 couples were also excluded. Two couples had multiples and due to the greater likelihood that these babies would be born early or small due to being a multiple alone, these couples were excluded. The final sample size was 270 couples who gave birth to 270 infants.

One birth weight outlier was identified using the Outlier Labeling Rule as described by Hoagline,

Iglewicz and Tukey.[156] The value for this case (915 grams) was Windsorized to the next lowest value (1,390 grams).[157] Four gestational age outliers were identified using the Outlier Labeling Rule. The values for these cases (27.14-34.00 weeks) were Windsorized to the next lowest value (34.57 weeks).[56]

Model Specification and Identification

I calculated Cronbach's alphas for discrimination, perceived stress and depression scales to estimate the reliability of these scales (Table III-1, column 5). Alpha values were high (ranging from 0.74 to 0.94). I did not calculate a Cronbach's alpha for the stressful life events measure because, as an index, a participant's endorsement of one item should not necessarily be related to the endorsement of another item if the events are independent.[158]

Because participants were part of couples (i.e. dyads), clustering effects were likely. I estimated Spearman's rank correlation coefficient (rho) to determine the collinearity of dyad members' data (Table III-2). In the structural equation model, covariances were drawn between the error terms of the maternal and paternal stress variables to account for clustering as recommended by Kenny et al. (2006).[159]

Table III-2. Correlations between maternal and paternal stress predictor variables

Spearman's Rho				
		Men		
		Stressful life events	General discrimination	Perceived Stress
Women	Stressful life events	.22**	.06	.10
	General discrimination	.10	.15*	.12*
	Perceived Stress	.10	.03	.29**

*Correlation is significant at the 0.05 level (2-tailed)
**Correlation is significant at the 0.01 level (2-tailed)

Estimation

The model was estimated using maximum likelihood, which compared the likelihood of the given model to the likelihood of a model with perfect fit. This method was preferred because it is asymptotically unbiased and is scale invariant.[160] Unstandardized coefficients were calculated to allow for comparison of coefficients between mothers and fathers.[159]

Testing

Global fit indices recommended by Bollen and Long (1993),[161] and Blunch (2008)[155] were assessed. The overall chi squared test of model fit was calculated; however, because this fit index is sensitive to sample size, the Tucker Lewis Index (TLI), the Root Mean Square Error of Approximation (RMSEA) and the p value of close fit (PCLOSE) were also calculated.[155]

c. Results

c.1 Descriptive Statistics

The sample is described in detail in Table III-3. On average, the women in this study were 18.7±1.6 years old and their male partners were 21.3±3.9. The average age difference was 2.6 ±3.3 years. Most of the participants were black (38.2% women and 46.7% men) or Hispanic (40.7% women and 38.2% men). Just over half of the women were in school or working, while nearly three-quarters of the men were in school or working. The average annual household income of women and men was

quite low ($13,567 and $17,518, respectively). The average birth weight of the baby was 3,219.2±528.2 grams and 5.6% had a low birth weight. The average gestational age at delivery was 39.3±1.8 weeks and 7.8% of babies were born preterm.

c.2 Latent Variable Model Building

The first step in the analysis was to evaluate whether the three measures of stress (stressful life events, general discrimination and perceived stress) could be represented by a single, higher-order latent factor called maternal and paternal "stress." Separate stress latent factors were created for men and women. Based on the significant correlations between maternal and paternal measures of stress (Table III-2), I allowed correlations between the maternal and paternal residuals for each measure as well as correlations between maternal and paternal latent "stress" factors.

All path coefficients between the stress measures and the stress factor were statistically significant and greater than or equal to 0.40 (p's < .05) (Table III-6). The model of the higher-order latent stress factors exhibited good fit (X^2 =9.88, df=5, p=0.08; TLI=0.93; RMSEA=0.06 (0.00-0.12); PCLOSE=0.32).

Table III-6. Factor loadings onto women's and men's stress latent variables.

Women's Stress Latent	Estimate
General Discrimination	.91
Stressful Life Events	.52
Perceived Stress	.40
Men's Stress Latent	
General Discrimination	.68
Stressful Life Events	.51
Perceived Stress	.48

Factor structure invariance by gender and race/ethnicity

I tested the possibility that the way the stress measures load onto the stress latent factors could differ between men and women. The model fit did not differ significantly when constraining the loadings of each measure on to the latent stress constructs to be equal for men and women compared to a model when the measure loadings were allowed to vary by gender (X^2_{diff}=0.63, df=2, p=0.73).[159]

Therefore, I concluded that the measures of stress loaded similarly for the maternal and paternal stress latent factors.

I also tested the possibility that the factor structure differed by race/ethnicity. Because the "white" group was small, I compared the factor structures of blacks versus Hispanics. The model fit did not differ significantly when constraining the latent factors to be equal for black and Hispanic women (X^2_{diff}=3.84, df=6, p=0.70) nor black and Hispanic men (X^2_{diff}=6.35, df=6, p=0.39).[162] Therefore, I concluded that there was configural invariance by race/ethnicity.

c.3 Influence of the latent stress factors on birth weight and gestational age

Next, I created a model to examine the influence of the maternal and paternal latent stress factors on birth weight and gestational age (without covariates). The model exhibited good fit (X^2=14.23, df=13, p=.36; TLI=0.99; RMSEA=0.02 (0.00-0.07); PCLOSE=0.83). The path from paternal stress to gestational age was significant (B=0.29, P=.03) and the path from paternal stress to birth weight was marginally significant (B=71.30, P=.07). Both paths were positive (i.e. greater stress associated with better birth outcomes). The paths from maternal stress to gestational age (B=0.02, P=.90) and birth weight (B=-28.04, P=.43) were not significant, although the path to birth weight was in the expected negative direction.

A model adding in all maternal and paternal covariates except substance use (demographic characteristics, clinical risk factors, baby gender) also exhibited good fit (X^2=191.66, df=110, p<.001; TLI= 0.89; RMSEA= 0.05 (0.04-0.07); PCLOSE= 0.36). I did not include substance use covariates for all remaining analyses because, from a stress and coping framework,[163] substance use may be better described as a mediator between the effect of stress on birth outcomes rather than a confounder that I need to adjust for. The path from paternal stress to gestational age remained significant (B=0.31, P=.03) and the path from paternal stress to birth weight remained marginally significant (B=72.66, P=.06) and in

the positive direction. The paths from maternal stress to gestational age (B=-0.001, P=.99) and birth weight (B=-37.01, P=.29) remained not significant, and both paths were in the expected negative direction.

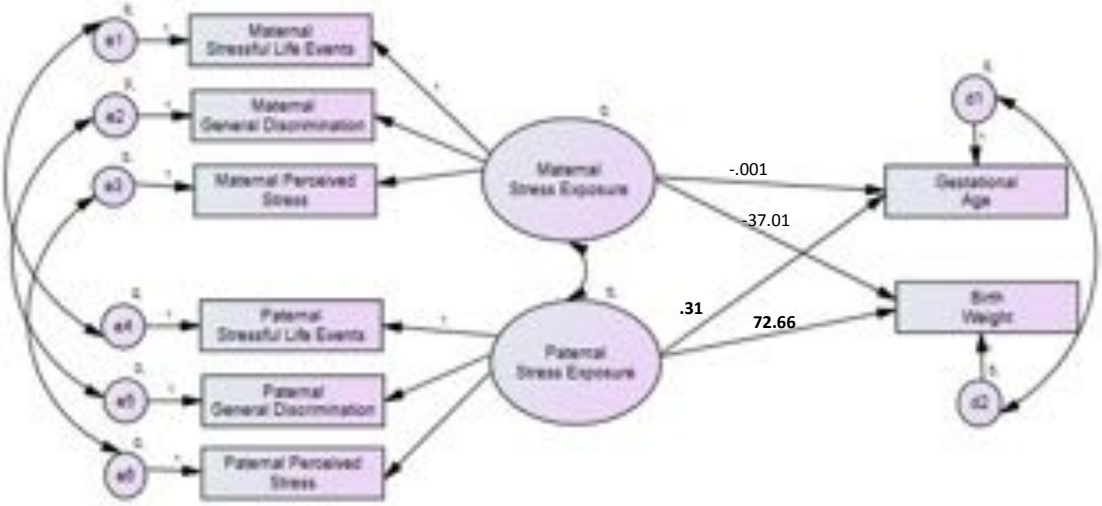

Figure III-2. Structural equation model examining the impact of the latent maternal and paternal stress factors on birth weight and gestational age at delivery accounting for covariates (demographic characteristics, clinical risk factors, baby gender). Bold path coefficients displayed are statistically significant (P<.05) or marginally statistically significant (P=.06)

To quantify the impact of paternal stress on gestational age, I used regression imputation to create values for the latent variable of paternal stress.[162] Fathers with the highest level of stress (splitting the imputed paternal stress variable at the median) had babies that were born about 0.5 days later (M=39.52, SD=1.26) compared to babies born to fathers with low levels of stress (M=38.99, SD=1.17, t=-2.46, P=.02). Fathers with the highest level of stress also had babies that were 94.75 grams heavier (M=3,268.32, SD=480.04) compared to babies born to fathers with low levels of stress (M=3,173.57, SD=557.24, t=-1.50, P=.14), although the difference was not significant.

c.4 Mediation by depressive symptoms

Next, I examined mediation of the effect of paternal stress on birth outcomes by maternal and paternal depressive symptoms by entering maternal and paternal depressive symptom variables into the model that also accounted for all covariates (Figure III-3). The model fit was acceptable (X^2 =295.99, df=151, p<.001; TLI=0.85; RMSEA=0.06 (0.05-0.07); PCLOSE=0.06). To examine mediation by depressive symptoms, I first explored whether paternal stress was associated with his own and his partner's depressive symptoms. Greater paternal stress was only associated with his own depressive symptoms (B=6.33, P<.001). Second, I examined whether paternal depressive symptoms were associated with either birth outcome. Paternal depressive symptoms were not significantly associated with gestational age (B=-.01, P=.53) or birth weight (B=-3.94, P=.61).

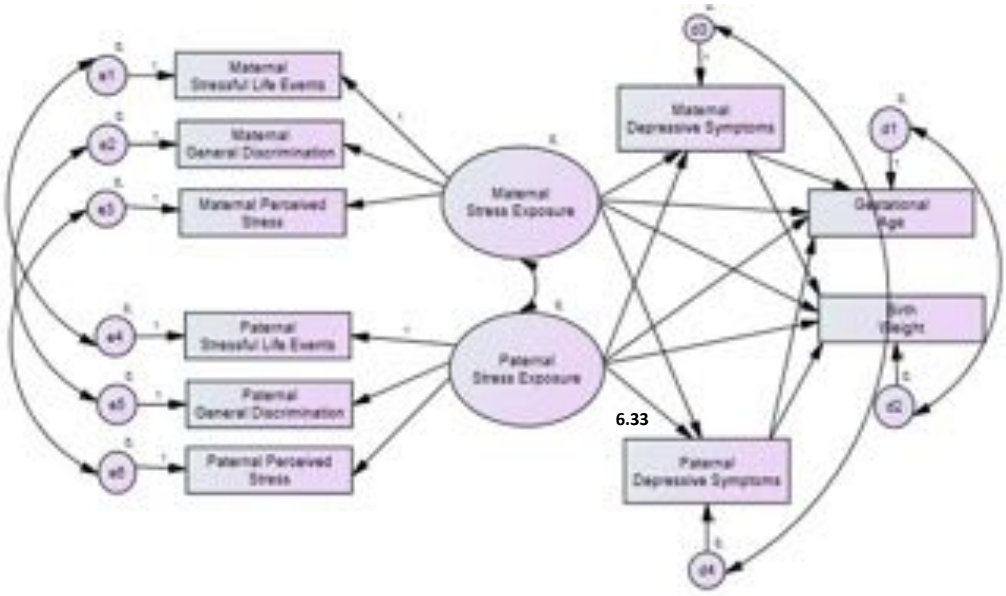

Figure III-3. Structural equation model examining mediation of the association between latent paternal stress factors on birth weight and gestational age at delivery by maternal and paternal depressive symptoms.

d. Discussion

Contrary to many published studies,[27,31–34,138] this analysis did not find a significant association between young expectant mother's stress during pregnancy and the gestational age at birth and birth weight of her baby. This analysis did find, however, that paternal stress during pregnancy was significantly *positively* associated with gestational age at birth—a finding that was contrary to my hypothesis that paternal stress would be negatively associated with birth outcomes. While the results were in the opposite of the expected direction, they suggest that paternal experiences during his partner's pregnancy are associated with his baby's birth outcomes and his experiences should not be ignored. In addition, the associations between paternal stress and the birth outcomes persisted after controlling for several important confounders, including clinical risk factors and demographic characteristics.

Lack of effect of maternal stress on birth outcomes

The lack of effect of women's stress on birth outcomes was contrary to much of the published evidence showing a significant negative effect of stress on birth outcomes.[27,31–34,138] the women in this study generally had low incomes ($13,590 household income) and were young. These young women were likely all under a high amount of stress as they grappled with potential relationship issues and financial challenges, while concurrently traversing the road to parenthood and adulthood. It is possible that all of the expectant women were under a high amount of stress and that there was not enough variability in the stress measure to identify an association with the birth outcomes.

In addition, the stress assessments used in this study did not include items that were specific to the stressors of pregnancy, which research has suggested may be a stronger predictor of birth outcomes among expectant mothers compared to general life event stress and perceived stress.[47] This may be an additional reason that I did not see an effect of maternal stress on birth outcomes. Pregnant women

(and their partners) may experience life events and worries that are specific to being pregnant, such as concerns about financially supporting a baby or worries about the health and development of their baby. Not including these relevant stressors may have led to inaccurate estimates of the level of stress and its impact on birth outcomes in this study.[86]

Positive effect of men's stress on birth outcomes

The lack of effect of maternal stress on birth outcomes coupled with the *positive* effect of paternal stress on birth outcomes suggests that there may be an alternative model for how stresses processes influence birth outcomes. My original hypothesis was based on the traditional theory of human stress characterized mainly by the fight-or-flight response, in which a stressor activates the HPA and the immune/inflammation pathways within an expectant mother, which could affect fetal growth and initiate premature birth.[27,138] This theory assumes that the physiological and behavioral cascade of events that follows a stress exposure is the same for men and women. However, as the "tend and befriend" model of female stress response proposes, maternal responses to stress may not be best characterized solely by the fight-or-flight response.[164,165]

The "tend and befriend" model suggests that under conditions of stress, women are more likely than men to affiliate with others and seek social support.[164–166] In contrast, men are more likely to display behaviors that are fight-or-flight related under conditions of stress, such as aggressive behavior and substance use. These gender differences in behavioral stress responses are thought to be informed by the human attachment system, which is activated particularly in times of stress. Research has shown that women tend to display more attachment anxiety than men, and men tend to display more attachment avoidance.[167] As such, under conditions of stress, women in this study may have sought substantial support from the father of their baby. This maternal support seeking behavior may have benefitted the well-being of the expectant mother; however, this increased support seeking from the

expectant mother may have caused her male partner more stress. Thus, the young men in this study may have provided more support to their expectant partner in this time of stress, which benefitted the expectant mother's health and well-being, and ultimately the baby's well-being, but at the cost of their own increased stress. In support of this hypothesis, I conducted a post-hoc analysis using imputed values of the stress latent variables.[162] I found that women's stress was significantly correlated with her own attachment anxiety (r=.40, P<.001),[7] and women's attachment anxiety was significantly correlated with men's stress (r=.15, P=.02). Unfortunately, the original study did not include a measure of support seeking.

Another potential explanation for this positive effect is that the women whose partners had the most stress are less involved with their partner and more involved with their own family, who provide compensating support for the expectant mother. A post-hoc analysis using imputed values of the paternal stress latent variable[162] found that men with high levels of stress (median split) reported greater depression, lower optimism, lower life satisfaction, and more smoking, alcohol use and marijuana use. Perhaps the expectant women whose partners are highly stressed and exhibit these unhealthy behaviors rely more on their own family for support, who compensate and ultimately help support a healthy pregnancy. Post-hoc t-tests showed that women whose male partner had the highest stress were significantly less likely to receive financial support from her male partner and marginally more likely to receive financial support from her own parent. The men with the greatest stress also reported more attachment avoidance and anxiety, which could have ultimately deterred a relationship from being close. In fact, the men with the highest level of stress had lower intensity of feelings for their partner.

[7] Attachment anxiety was measured using the Experiences in Close Relationships Inventory (ECRI) by Brennan, Clark and Shaver (1998)[168]

Unfortunately, the original study that this data come from did not have a strong measure of "closeness" of the couple. A proxy for closeness of the couple may be the living arrangement of the couple—and specifically whether the expectant woman lives with her own mother or not. A post-hoc analysis found that the when the mother of the baby lived with her own mother (and not the baby's father), men's stress did not have a significant effect on gestational age (B=-.04, P=.85); however, when she lived with the baby's father (with her own mother or not), men's stress had a significant positive effect on gestational age (B=.38, P=.03) when controlling for all covariates except substance use.

Given that men's stress still had a positive effect on birth outcomes among the "closest" couples, the "tend and befriend" model is still consistent with these outcomes. When couples are closer, the men may be a stronger support system for the expectant mother, which could benefit her health and well-being and ultimately the health of the baby. However, this support of the expectant mother may come at the expense of higher stress for the baby's father. While social support for pregnant women and new mothers is considered important in our society, we generally pay little attention to expectant and new fathers. Interventions that support not only expectant and new fathers, but also the relationship between expectant and new parents may be important to the health and well-being of the whole family system.

Lack of mediation by depressive symptoms

Depressive symptoms did not mediate the effect of paternal stress on birth outcomes. In this study, there was no evidence of stress and strain crossover between members of the couple.[169] Maternal and paternal experiences of stress were not associated with their partner's depressive symptoms. This may be due to the fact that these couples are young, nearly all unmarried and 46.7% of the young mothers still live with their own mothers. Evidence has shown that the closeness of a couple

may moderate the cross-over effect, with closer couples experiencing more cross-over of the effects of stress from one member to the other.[73] Many of the couples in this study may not have had close enough relationships for paternal stress to cross over and affect maternal feelings of stress and wellbeing. In a post-hoc moderated mediation analysis,[162] however, the effect of men's and women's stress on their partner's depressive symptoms still did not differ based on whether she lived with the father of her baby or with her mother (and not the baby's father) ($Z=-.71$, $P>.05_{\text{men's effect on women}}$; $Z=-.38$, $P>.05_{\text{women's effect on men}}$) when controlling for all covariates except substance use.

Concluding remarks and future research directions

Future studies would be strengthened by the inclusion of stress appraisals and perceptions. What is stressful for one person may not be stressful for another, and therefore the likelihood of reporting a stressful event may be affected by an individual's appraisal of the stressor.[90] Measures of stress appraisals and perceptions could ascertain the individual's perception and evaluation of potential harm posed by a specific external demand (i.e. stressor) and their ability to cope with the demand.[170] The inclusion of biological indicators of stress responses may also help elucidate this gap between whether a stressor actually has a physiological effect on the expectant mother that could ultimately affect the health and development of the fetus.[35]

Despite the fact that the findings from this investigation may leave us with more questions than answers about paternal effects on birth outcomes, even including father's experiences and feelings within birth outcome research is a step in the right direction as there has been virtually no investigation in this arena. The findings from this study suggest that there *is* a relationship between birth outcomes and men's experiences during pregnancy; however, the lack of consistency of the findings with accepted theory on how stress affects health indicates that more research is necessary. This is the first analysis to explore the effect of *paternal* stress on birth outcomes, and the pathways through which he has an

effect. This analysis also assessed direct report of stress exposures and responses from the fathers, avoiding measurement error associated with using maternal reports of paternal experiences.

The analytical techniques used in this research also strengthen the analyses. The analysis accounted for the correlated nature of maternal and paternal reports, while maintaining the strength of the total sample size (i.e. without conducting the analyses separately by gender). In addition, structural equation modeling allowed for the simultaneous assessment of multiple hypotheses involving complex pathways, while parceling out measurement error.

This is the first study in the literature to date that explores the role of expectant father's experiences of stress during his partner's pregnancy on his child's birth outcomes using direct report from the fathers and strong analytical techniques. The study demonstrates that paternal experiences of stress during his partner's pregnancy are significantly associated with birth outcomes, but not in the direction that is consistent with conventional theory of how stress is related to one's own and one's partner's health and well-being. This study offers a unique perspective building on the "tend and befriend" model to explain how greater paternal stress during pregnancy may be positively associated with his baby's birth outcomes. Future studies that further explore alternative models for how paternal experiences and well-being during pregnancy affect his baby's birth outcomes are warranted.

Chapter IV. Stress and Behavioral Risk among Young Expectant Couples

a. Introduction

Learning to cope with psychosocial stress is a fundamental component of adolescent development. Decades of research has shown us that exposure to stressors and the ways in which adolescents manage their emotions, thoughts and behaviors influence their mental and physical health.[171,172] Much research has helped elucidate the types of stress adolescents experience and the ways in which they cope, which can include unhealthy behaviors such as substance use (e.g.[143,173–179]). There has been little investigation, however, into the basic nature of stress and coping among adolescents who are expecting a baby. This population is important because their responses to stress (take for example, smoking) carry implications for the unborn child. In addition, coping styles (whether healthy or unhealthy) are sensitive to situational factors and developmental changes, such as pregnancy. Thus, coping behaviors exhibited during this sensitive period of fetal development may affect the child's health later in life. Pregnancy may further provide a window of opportunity for intervention—expectant parents are often motivated to change or establish healthy behaviors for the good of their child[180]—and pregnancy may be an opportune time to help couples learn to better manage stress in an effort to support their health and their relationship as parents. We need better information, however, about the nature of the stressors that *expectant* adolescents experience and their responses in order to inform effective interventions.

The experience of becoming a parent is a major life transition that may elicit many new stressors not only for young women, but also for the fathers of their baby. Despite the fact that pregnant adolescent females in the United States are usually unmarried,[39] many still have a relationship with the baby's father during pregnancy[65] and therefore, these young men are also experiencing the major life transition of becoming a parent. Substantial research has shown us that social support can improve coping and buffer the effect of stress on well-being [e.g. 69,181] and that romantic relationships can be a significant source of this much needed social support. Studies have also shown that a romantic

partner's experiences of stress can cross over and affect one's own well-being.[72,169] Despite the interpersonal nature of stress and coping, and the fact that romantic relationships are present and important among pregnant adolescents, few studies of adolescent experiences of stress during pregnancy include the direct report of experiences and behavioral responses of the baby's father.

This paper uses stress and coping theory, and stress and strain crossover theory to predict that expectant adolescents' and young adults' own experiences of stress are associated with their own *and their romantic partner's* health behaviors.

Stress and coping theory

Extensive research has demonstrated a consistent association between stress and health behaviors.[e.g.46,140,178,182,183] This research is based on the hypothesis that people use health behaviors to cope with the distress that they experience. Individuals experience stress when demands exceed the resources the individual has to deal with the demands.[140] When individuals appraise a stressor as harmful, threatening or challenging, they use coping strategies to regulate the stress they experience.[171,184] Some of the coping mechanisms are adaptive and promote health and well-being, such as *active coping* (addressing or altering a stressor through active problem solving,) and *support seeking* (obtaining emotional support from a social network). Other coping mechanisms may lead to behaviors and emotions that can lead to poor health and well-being, such as *disengagement* (avoiding, withdrawing from or denying a stressor) and *distraction* (doing things that take the mind off the stressor).[171,184,185] Negative health behaviors, including substance use and venting anger (which could lead to conduct problems), can serve as a way for adolescents to withdraw from or keep their mind off a stressor, reduce emotional distress or release negative feelings.[163]

Adolescents and young adults may also use negative health behaviors to cope with new and challenging stressors because they may not have developed healthier coping strategies. Adolescent's problem solving abilities, regulation of emotions, empathy and perspective-taking ability are still evolving during this developmental period.[186] Thus, adolescents may use negative health behaviors as coping mechanisms because they have not learned to employ other more adaptive coping strategies, such as identifying and actively pursuing alternative solutions.

Additionally, there is evidence that men and women have different reactions to stress. Studies have found that men are more likely to exhibit externalizing coping behaviors, such as substance use, in response to stress, while women are more likely to exhibit internalizing behaviors or affect (e.g. depressive symptoms) in response to stress.[187,188] The "tend and befriend" model of the stress response proposes that under conditions of stress, men are more likely than women to display "fight-or-flight" related behaviors, such as substance use and aggressive behaviors. This model also suggests that stress is more likely to cause women to affiliate with others and seek social support.[164–166]

Sources of stress and evidence of the impact on adolescent and young adult health behaviors

Adolescents and young adults experience stressors that emanate from various life domains, including close relationships (e.g. a fight with a romantic partner) and general personal hardships (e.g. having something important stolen).[172,189] For adolescents and young adults who are racial and/or ethnic minorities and are from a low socioeconomic status (SES), daily stressors often extend beyond these typical developmental challenges. This population is disproportionately affected by other more severe and chronic stressors, such as neighborhood problems, racism and discrimination.[38] Coping strategies that are typically viewed as the most adaptive and produce the most positive outcomes, may not be realistic or even safe for adolescents within these circumstances. For example, one study found that active coping in response to exposure to violence was associated with increased aggression among

impoverished urban adolescents.[190] In the face of chronic and severe stressors that adolescents have little control over, such as discrimination and neighborhood problems, avoidant coping strategies (such as substance use as a method of disengagement and distraction) that afford them some transcendence from the day to day burden of stress may actually be an adaptive response and even have some benefits.[38,190]

Substantial evidence, discussed below, has demonstrated a link between experiences of stress in each of these domains and negative health behaviors among adolescents and young adults. Neighborhood problems disproportionately affect minority and low-income communities and have been consistently linked to negative health behaviors among adolescents. Neighborhood problems, such as vandalism, rundown buildings, drugs and fights in the streets, become chronic stressors that may elicit negative coping mechanisms among adolescents living in the neighborhood.[143,173] For example, Kowaleski-Jones (2000) reported that perceived neighborhood problems were related to deviant behavior.[175] Among a sample of adolescents in Los Angeles, the perception of their neighborhood as dangerous was related to more oppositional defiant disorder and conduct disorder.[176]

Experiences of discrimination have also been linked to negative health behaviors among adolescents. A nationally-representative survey of African American adolescents found that 87% experienced at least one source of discrimination in the previous year.[191] Several studies among adolescents and young adults show that experiences of discrimination predict greater smoking[177] and other substance use.[182,192]

Discrete life stressors or personal hardships, referred to as stressful life events, are also common among adolescents and young adults. These stressful life events, such as losing a job or having something stolen, have been consistently associated with smoking,[178,182,183] and alcohol use[182] among adolescents and young adults. Further, among adolescents, experiencing more stressful life events has also been associated with greater conduct problems.[193]

Other discrete stressors stemming from important social relationships (e.g. parents and romantic partners) can have a significant influence on adolescent and young adult behavior. During adolescence and young adulthood, social relationships within and outside of the family, including romantic relationships, are extremely important.[97] Acute social-relationship stressors, such as family conflict[194] and romantic relationship dissolution[179] have been related to more substance use among adolescents and young adults.

Stress and the effects on health behavior among pregnant adolescents and young adults

Another important factor impacting the stress experienced by adolescents and young adults is their experience of pregnancy. Ethnic and/or racial minority adolescents and young adults experience a disproportionately high pregnancy rate.[195] Pregnancy can be a stressor for an expectant parent of any age or gender.[148,196] Pregnancy involves significant emotional and physical demands. It is also a major life transition that elicits many stressors, such as concerns over finances, health, and relationships with a romantic partner and family. For adolescents and young adults, the transition to parenthood may further overload coping resources and be exceptionally stressful.[149,197] This stress may lead to engaging in poor health behaviors, even among expectant mothers who intended to abstain from substance use during pregnancy. Many studies have demonstrated that maternal stress during pregnancy is associated with poor maternal health behaviors (e.g. smoking and substance use),[46,139] although these studies have been conducted among adult women.

There is very little research exploring experiences of stress and health behaviors among expectant fathers (of any age), despite the fact that a partner's pregnancy is also a major life transition for expectant fathers who may also have concerns over many issues, including finances and relationships. A young man's experiences during pregnancy may impact his own health and behavior, as well as his pregnant partner's behavior, carrying implications for the health and development of their

child. Substantial evidence has shown that social relationships have important influences on our health and well-being.[62] A majority of expectant female adolescents and young adults are involved with the baby's father during pregnancy,[65] and therefore he likely has an important influence on her during her pregnancy.[98] Despite this fact, the paternal experience during pregnancy has largely been ignored in the literature, and when it is acknowledged, it is usually reported by the expectant mother, introducing potential measurement error.

Stress and strain crossover: theory and evidence

While substantial evidence demonstrates that experiences of stress are predictive of one's own health behaviors, some evidence suggests that experiences of stress can also crossover and affect the well-being of one's romantic partner.[72,169,198] For example, a woman's partner's experiences of stress have been associated with increases in her own depressive symptoms.[72] It is thought that stress can be transferred from one person to the next through the socio-emotional process of empathetic distress, or the "emotional involvement in the problems and distressed feelings of a relationship partner, to the point of taking on the partner's emotional distress and experiencing it as one's own."[199] While empathy for others is considered a developmentally adaptive competency[200] and is fundamental to the development of close relationships,[201] evidence has shown that there can be substantial emotional "costs of caring"[202] that can be mediated by this process of empathetic distress.[199]

This crossover of stress has been documented among young adolescent friend pairs, with young women reporting more empathetic distress than young men.[199] Given evidence that men and women report different patterns in internalizing and externalizing responses to stress,[187,188] it is possible that young men may report less empathetic distress, but more externalizing coping behaviors (e.g. substance use) as a result of his partner's stressful experiences.

Current study

Many studies have shown that an adolescent's experiences of stress have a negative influence on their own health behaviors (e.g.[143,173–179]) and at least one study has shown that adolescents' experiences of stress can influence a close friend's emotional distress.[199] There is also a substantial literature focused on the transmission of job-related stress among husbands and wives.[72]

Very little attention has been paid to the consequences of experiences of stress on romantic partners—someone with whom a pregnant adolescent or young adult has an important relationship and interacts frequently. No research to our knowledge has explored paternal experiences of stress during his partner's pregnancy and the effects on his own and his pregnant partner's health behaviors. Further, no studies have explored whether experiences of stress can crossover and affect a romantic partner's health behaviors among adolescents and young adults who are expecting a baby.

The current study aims to fill these gaps in the literature by examining how both personal and partner experiences of stress are associated with poor health behaviors during pregnancy among a sample of expectant adolescent and young adult couples who are largely racial and/or ethnic minorities and have a low socioeconomic status. First, I describe expectant parents' experiences of stress during pregnancy across several domains (e.g. personal hardship, close relationship stressors, neighborhood problems and discrimination). Second, drawing from stress and coping theory, I describe the association of these experiences with negative health behaviors and mental health (substance use, conduct problems and depressive symptoms). Third, I draw upon stress and strain crossover theory to explore partner effects—the association between a *partner's* experiences of stress with one's own poor health behaviors and mental health.

b. Methods

b.1 Data Source

The current study is a secondary cross-sectional data analysis of baseline data collected between 2007 to 2011 from 296 expectant young couples (females ages 14–21 years and their male partners ages 14+ years) enrolled in a longitudinal study of relationships and health during the transition to parenthood. Detailed study procedures are published elsewhere[203] and within the previous chapter. In short, young women and men in a romantic relationship and expecting a baby were recruited from four urban university affiliated hospital-based clinics in southern Connecticut (CT) (Yale University Women's Center and ultrasound clinic, Bridgeport Hospital OB/GYN clinic, New London OB/GYN clinic, and Hospital of St. Raphael OB/GYN clinic). The couples completed separate audio computer-assisted self-interviews (A-CASI), which allows participants with low literacy to complete the survey [204] and elicits more accurate and valid responses to sensitive questions.[205,206] Of the 413 eligible couples screened, 72.2% enrolled. Compared to those who refused to participate, participants were on average two weeks further along in pregnancy at screening ($P < 0.03$). Participants versus those who refused participation did not vary by any other pre-screened demographic characteristic (all $P > 0.05$).

A research assistant obtained informed consent from the each member of the couple (individually) at the baseline survey. Participation was voluntary, confidential, and did not influence the provision of health care or social services. All procedures were approved by the Yale University Human Investigation Committee and by Institutional Review Boards at study clinics. IRB approval to use the deidentified PARTNRS data was also obtained from the CUNY Graduate Center.

b.2 Measures

Stressors

Stressful life events related to *close relationships* and *personal hardship* were evaluated by adapting the Life Events Scale.[151] Respondents indicated whether they had experienced 11 stressful life events in the previous 6 months. Four stressful life events, including broke off a steady relationship, a relative suffered a serious illness, injury or assault, a family member or close friend died and had a serious problem with a friend, neighbor, or relative, were grouped and summed as *events related to close relationships*. Seven stressful life events, including having money problems, being unemployed, moving, having something lost or stolen, problems at work or school, problems with the police, and suffered a serious illness, injury or assault, were grouped and summed as *events related to personal hardship*. Higher scores on this measure indicate the respondent experienced more stressful life events.

Respondents' perception of *neighborhood problems* was assessed using a 15-item adapted version of the Perceived Neighborhood Problems Scale.[207] Respondents indicated how much various neighborhood problems were an issue in their neighborhood, on a 3-point scale ranging from 1="not a problem" to 3="serious problem." Sample items from the original scale include "smells and fumes," "assault and muggings," and "vandalism." Two additional items were added to the original 13-item scale: "feeling unsafe after dark" and "drugs." Responses to items were summed to form a total *neighborhood problems* scale ranging from 15 to 45 (= .95).

Perceived *general discrimination* was assessed using a 20-item adapted version of the Daily Life Experiences Scale, a subscale of the Racism and Life Experiences Scales.[208] Items concerned how often respondents experienced discriminatory treatment, such as not being given service in a store or restaurant, or being stared at by strangers. Responses were indicated on a 6-point scale ranging from 0="Never" to 5="Once a Week or More." A mean score was calculated from the 20 items to form the *general discrimination* score (= .93).

Health Behavioral Risk

Smoking, drinking, marijuana use and hard drug use were measured using an adapted, 7-item version of the Recreational Drug Use Scale.[153] Frequency of use during the past three months for each substance (alcohol, cigarettes, marijuana, crack, heroin, methamphetamines, and "other hard drugs") was assessed using a 5-point Likert scale, ranging from 0 = "Never" to 4 = "Every Day." The adapted version included the item "other hard drugs" in lieu of the individual items in the original scale of barbituates, ectasy, gammahydroxybutyrate (GHB), hallucinogens and inhalant nitrates. We summed the report of the use of crack, heroin, methamphetamines, and "other hard drugs," to form a total *hard drug use* score (range 0 to 16) due to the low frequencies of these individual items.

Conduct problems were assessed by means of an adapted, 7-item version of the DSM Conduct Problems Scale.[209] Respondents reported the frequency of various conduct problems in the previous 6 months on a 4-point scale ranging from 1= "Not at All" to 4="5 or more times." Sample items included "skipped school or work," "got in a fight," and "stole something." Items were summed to form a total conduct problems score ranging from 7 to 28, with higher scores indicating more conduct problems.

Mental Health

Depressive symptoms over the past week were measured using 15 of the 20 items in the Center of Epidemiological Studies-Depression Scale (CES-D).[91] Participants responded on a 4-item scale ranging from 0="Less than 1 day" to 3="5-7days". Items included "during the past week I had crying spells" and "during the past week I felt depressed."

b.3 Statistical Analysis

I produced descriptive statistics using IBM SPSS Statistics V22 (IBM Corporation, Armonk, NY) of the demographic characteristics, stressors and behavioral risk outcomes among the sample population. Two men were missing data for stressful life events and therefore I excluded two couples from the analysis resulting in a final sample of 294 couples (n = 588). I used paired t-tests and McNemar's tests to

compare the demographic characteristics, stressors and behavioral risk outcomes variables between paired men and women.

I used multilevel modeling to explore the relationship between experiences of stressors and the behavioral risk outcomes during pregnancy: smoking, drinking, marijuana use, hard drug use, conduct problems and depressive symptoms. Specifically, I used the Actor-Partner Interdependence Model (APIM), to account for the correlated nature of the data. This model allowed me to assess the influence of both the respondent (actor effect) and their partner (partner effect). An actor effect indicates whether a respondent's score on a predictor variable is associated with their own outcome (e.g. woman's experiences of stressors relates to her own smoking). A partner effect indicates whether a respondent's partner's score on the predictor variable is associated with the respondent's outcome (e.g., male partner's experiences of stressors influences his female partner's smoking). The APIM uses a single analysis to incorporate responses from both members of a couple and treats the members of a couple as nested scores within the same group.[210] A detailed description of APIM analyses using multilevel modeling programs by Kenny, Kashy, & Cook (2006) served as the guide for our analysis plan. Analyses involving hard drug use were restricted to the male data because no females reported hard drug use. To assess whether gender moderated the influence of stressors on all other health behavior outcomes, gender by stressor interaction terms were tested.

All models controlled for maternal and paternal age, education, income and race/ethnicity. In addition, analyses controlled for role occupancy (defined in this analysis as whether they worked, went to school or had other children) because people who have greater role occupancy are likely exposed to more stressors.[81]

c. Results

c.1 Descriptive Statistics

Demographic characteristics of the participants are displayed in Table IV-1. The young men were generally older, had more personal income, were more likely to be employed, and were less likely to be in school compared to their female partners.

Table IV-1 also shows that young men and women reported similar amounts of stressful life events related to close relationships and stressful life events related to personal hardship (both P>.05). Young men reported more neighborhood problems (22.4% vs. 24.4%, P<.001) and more general discrimination (M=0.9 vs. M=1.0 out of 5, P=.02) compared to young women. Table IV-2 shows that money problems were the most common life event stressor in the past six months among both men and women. About one third of the respondents also reported moving within the past six months.

c.2 Multilevel Regression Analyses

Table IV-3 shows the results of the multilevel regression models examining the association between the stressors and the outcomes. Each outcome was tested in separate models controlling for all demographic characteristics. The results below describe the results of the gender interaction analyses. Because many of the outcome variables did not have a normal distribution, I also ran multilevel linear regression models with natural log transformed outcomes. The tables are shown in Appendix III-3. The results were substantively the same so only the results from the linear regression models are shown in the main text.

[8] This item refers to any relationship, including the current relationship. Each individual provided his/her own response. Discrepancy in the couples percentages here indicate that participants may have had other relationships in the previous six months and/or may not perceive a "break-up" the same way.

Personal Hardship Stressors and Health Behaviors and Mental Health

Among the total sample, in adjusted models greater frequency of personal hardship stressors predicted more smoking (B=.08, SE=.04, t=2.09, p=.04), marijuana use (B=.04, SE=.02, t=1.90, p=.06), conduct problems (B=.45, SE=.11, t=4.26, p<.001) and depressive symptoms (B=0.41, SE=0.22, t=1.87, p=.06) (Table IV-3). Gender interacted with personal hardship stressors when predicting marijuana use (t=1.96, P=.05) and alcohol use (t=1.97, P=.05). Greater frequency of personal hardship stressors was associated with more marijuana use (B=.14, SE=.05, t=2.76, P=.006) and alcohol use (B=.10, SE=.04, t=2.817, P=.005) among young men only. Gender also interacted with *partner's* personal hardship stressors when predicting marijuana use (t=2.66, P=.008) and depressive symptoms (t=-2.11, P=.04). Greater frequency of *partner's* personal hardship stressors was associated with less marijuana use (B=.13, SE=.05, t=-2.48, P=.014) and more depressive symptoms (B=0.77, SE=.28, t=-2.79, P=.006) among young men only.

Close Relationship Stressors and Health Behaviors

Gender interacted with close relationship stressors when predicting smoking (t=2.096, p=.037) and marijuana use (t=2.92, p=.004). Greater frequency of close relationship stressors predicted more smoking (B=.22, SE=.09, t=2.44, p=.015), marijuana use (B=.30, SE=.08, t=3.58, p=<.001) and hard drug use (B=.34, SE=.09, t=3.81, p<.001) among young men only. Gender also interacted with *partner's* close relationship stressors when predicting conduct problems (t=2.1, P=.04). Greater frequency of *partner's* close relationship stressors related to more conduct problems among young women only (B=.58, SE=.20, t=2.88, p=.004).

Neighborhood Problems and Health Behaviors

Among the total sample, in adjusted models greater frequency of neighborhood problems predicted more smoking (B=.02, SE=.01, t=2.94, P=.001) and depressive symptoms (B=.07, SE=.04, t=2.00, P=.047) . Gender interacted with neighborhood problems when predicting smoking (t=2.09, P=.037), alcohol use (t=2.63, P=.009), marijuana use (t=3.30, P=.001) and neighborhood problems (t=2.42,
P=0.16). Greater frequency of neighborhood problems predicted more smoking (B=.04, SE=.01, t=3.89, P<.001), alcohol use (B=.02, SE=.007, t=3.035, P=.003) and marijuana use (B=.03, SE=.008, t=3.77, P<.001) among young men only. Greater frequency of neighborhood problems predicted more depressive symptoms (B=.12, SE=.04, t=2.71, P=.007) among young women only. Gender interacted with *partner's* neighborhood problems when predicting smoking (t=-2.07, P=.039). Greater p*artner's* neighborhood problems related to less smoking among young men only (B=-.02, SE=.01, t=-2.02, P=.04).

General Discrimination and Health Behaviors

Among the total sample, in adjusted models greater frequency of general discrimination predicted more conduct problems (B=1.17, SE=.16, t=7.35, p<.001) and more depressive symptoms (B=1.41, SE=.33, t=4.27, P<.001). Gender interacted with general discrimination when predicting alcohol use (t=2.63, P=.009) and depressive symptoms (t=-2.54, P=.01). Greater frequency of general discrimination predicted more alcohol use (B=.15, SE=.06, t=2.652, P=.008) and hard drug use (B=.22, SE=.08, t=2.82, P=.01) among young men only. Greater frequency of general discrimination predicted more depressive symptoms among both young men (B=2.68, SE=.56, t=4.81, P<.001) and young women (B=.86, SE=.38, t=2.29, P=.02) although the effect was much stronger for men than women.

Table IV-3. Multi-level linear regression models examining relationship between stressors (own and partner's) and behavioral risk and depressive symptoms. All models control for age, education, income, race/ethnicity, parity and employment status.

	Partner's		

[a] Examples of how to read this table: Greater frequency of partner's personal hardship stressors associated with greater depressive symptoms among men. Greater frequency of one's own experiences of discrimination associated with own depressive symptoms among men and women.

d. Discussion

The findings of this study demonstrate that one's own experiences of several types of stressors are related to substance use, conduct problems and depressive symptoms among both expectant women and men. Negative health behaviors common during adolescence and young adulthood predict future patterns of behavior and health outcomes into adulthood. These behaviors are also important due to their capacity to also affect the health of their baby.

The evidence from this study also concurs with the stress and strain crossover theory, in which stressful experiences in one's own life, cross over and affect the health and well-being of a close partner.[72] While several studies have demonstrated that maternal stress is associated with poor maternal health behaviors during pregnancy,[46,139] this study is the first to show that *paternal* experiences of stress are predictive of maternal conduct problems. Previous studies examining the patterns and predictors of maternal health behaviors have largely neglected paternal influences, despite increasing evidence that social relationships influence health behaviors.[211]

Personal experiences of stress and one's own health behaviors

This study identified several domains of stress that were associated with behaviors among young men becoming fathers. Notably, greater personal experiences of all sources of stress (relationship stressors, personal hardship stressors, neighborhood problems and discrimination) were associated with more substance use among the young men in this study. While most research has focused on predictors of maternal health behaviors, understanding the predictors of *paternal* health behaviors has important implications not only for his health, but for his pregnant partner's health as well. Men's negative health behaviors, such as smoking, can directly influence maternal health (e.g. by

increasing her exposure to second hand smoke) and men's health behaviors can influence his partner's health behaviors. For example, studies have shown that women are less like to quit smoking during pregnancy if her partner smokes.[212] Programs and interventions that aim to reduce substance use among young expectant mothers may be more effective if the substance use of *both* parents is addressed.

Among the young women in this study, however, significant associations between stress and substance use were sparse. I did find, however, that experiences of personal hardship stressors were associated with more smoking among women. The lack of consistent associations between maternal stress and substance use in this study may be an artifact of the low prevalence of the report of substance use among the women. These results, however, may show that the stressors that affect paternal and maternal substance use during pregnancy may be different. Previous research has shown that different types of stressors predicted smoking among adolescent girls compared to boys.[213] Previous research has shown that young men and women may use different coping mechanisms to deal with stress[166,214] and the evidence from this study may suggest that young expectant men use substance use as a coping strategy for stress more often than young expectant women.

Partner's experiences of stress and one's own health behaviors

A majority of previous evidence supporting the stress and strain crossover theory has found negative effects of stress and strain on a partner's well-being.[169] Contrary to this evidence and our hypothesis, all of the significant effects of the young men's partner's stress (i.e. the association between women's stress with her male partner's behaviors) were associated with *less risk* behavior and *more protective* behavior. Young women's personal hardship stressors were significantly associated with less marijuana use among her male partner, and more women's neighborhood problems were

significantly associated with less smoking among her male partner. This study, however, found that young men's depressive symptoms were directly associated with his partner's personal hardship stressors. This evidence is consistent with the theory of empathetic distress in which a person takes on the experiences of stress and distressed emotions of his/her partner and experiences them as one's own."[199]

These findings suggest that not all experiences of stress necessarily translate into negative effects on a partner. Popular culture may portray young expectant women's partners only as sources of stress or complication; however, the findings from this study suggest that young men who see that their partner is under significant stress, may improve their health behaviors for their partner's benefit and may empathize with their partner's troubles to the point that they take on the distressed emotions as their own. For all of the negative portrayal of young fathers, they can be an important source of support[215] and fathers may have a meaningful influence on the health behaviors of their pregnant partners.[216]

Strengths, Limitations and Future Research Directions

This secondary data analysis has several limitations. This study was cross-sectional and therefore experiences of stress and behavioral risk were assessed at the same point in time limiting our ability to infer causation. The timeframes referenced by each question, however, make the direction of the hypothesized association plausible. The risk behavior items referred only to behaviors in the previous 3 months. Both personal hardship and close relationship stressors referred to experiences within the past six months. While neighborhood problems and general discrimination were more general questions referring to their daily life, these constructs are likely consistent over time.

Also, pregnant women reported few negative health behaviors in this study during pregnancy. Therefore, the association between experiences of stress and behavioral risk among the women in this sample may be spurious; regardless, I was able to identify a few significant relationships between stress and health behaviors among the women.

Despite these limitations, this study is one of the few that includes a direct report from men of their experiences of stress during their partner's pregnancy and its relationship to risk behavior. In addition, this study includes an assessment of stressors from multiple sources and the distinct relationships with behavioral risk outcomes across these predictors for both men and women. This study also assessed the influence of a partner's experience of stress on behavioral risk, which very few studies, if any, have done. In addition, this study assessed stress crossover from both sides of the couple—many studies just focus on crossover from one member of the couple to the other.[169]

In conclusion, this study filled important gaps in the literature on the factors influencing the health behaviors of young couples expecting a baby. The findings demonstrate that experiences of stress across multiple life domains are associated with both maternal *and paternal* health behaviors among young couples during pregnancy. Interventions that address healthy coping mechanisms among this population may help reduce these unhealthy behaviors. Programs and interventions targeting prenatal health behaviors (particularly among adolescents and young adults) overwhelmingly neglect young male partners of the expectant young woman. These findings indicate that stress is associated with young men's health behaviors during this time. These health behaviors have important implications for their health into adulthood and for the health of their partner and child.

This research also revealed that young women's experiences of stress can crossover and impact the health behaviors of her romantic partner—but, not in the expected negative direction. The more stress a young expectant woman experienced in multiple domains, the less risk behavior her young male partner reported. The male partners of young expectant women can be an important source of

support and may have a significant influence on the health of their pregnant partners. It is critical that programs and interventions aimed at improving young women's prenatal health behaviors include romantic partners, when feasible and desired by both members of the couple, and address the importance of the influence of this relationship on their own and their baby's health.

Chapter V. *Conclusion*

This dissertation tested dyadic models of the association between both maternal and paternal reports of relationship quality and stress during pregnancy with prenatal health behaviors and birth outcomes. It is the first research to assess the effect of direct report of paternal experiences of stress and relationship quality on birth outcomes. It is also the first research of its kind to use dyadic data analysis methods to parcel out the independent and interactive effect of each parent among couples on birth outcomes—particularly among young couples who I hypothesized may be particularly susceptible to stress and its effects on birth and child outcomes.

The first paper in this dissertation demonstrated that father's report of conflict with his partner and his presence at birth were both significantly associated with having a baby with a lower birth weight and an earlier gestational age at birth among a national sample of married and unmarried parents in a relationship. The magnitude of the effect of the father's presence at birth was similar to that of light smoking during pregnancy. This is the first study to demonstrate an association between direct *paternal* reports of relationship conflict and birth outcomes. Research examining the impact of fathers on birth outcomes has largely been limited to demographic factors (age, race, etc.), and maternal reports of paternal involvement and support, and the measures of these constructs are almost always very crude (e.g. father's name on birth certificate).[68,217]

This paper also found an interactive effect of maternal and paternal reports of relationship conflict on birth outcomes. Average birth weight was the lowest when both parents reported high levels of conflict with their partner. Low levels of conflict as reported by mothers were protective. When mothers perceived low levels of conflict, the father's report of conflict did not have an effect on birth weight; however, when mothers reported high levels of conflict, greater paternal report of conflict was associated with worse birth outcomes.

Consistent with previous studies finding that maternal report of paternal support during pregnancy was positively associated with birth outcomes, this paper found that the baby's father's presence at the birth predicted that their babies weighed 98.8g more at birth and had an average of 3.5 days longer gestation. The baby's father's presence at birth may be a crude indicator of his support of his partner and his involvement with the pregnancy. This finding is consistent with the theory posed by Alio and colleagues (2010) in which support from the baby's father during pregnancy may decrease maternal stress and encourage healthy behaviors, ultimately leading to better birth outcomes.[68] This finding may indicate that we may be able estimate population level effects of paternal support by using paternal attendance at the baby's birth as a proxy within analyses of nationally representative surveys, since it is a simple measure to employ.

The second paper in this dissertation did not find an association between maternal report of stress during pregnancy with either gestational age at birth or birth weight among a sample of 296 young expectant couples. The analysis did find, however, that men's experiences of stress were *positively* associated with gestational age at birth and birth weight (marginally significant), both before and after controlling for important confounders. This finding contradicted my hypothesis that men's stress would be negatively associated with birth outcomes; however, the finding does suggest that men's experiences during pregnancy matter to birth outcomes.

The results of the analyses in this paper are more consistent with the "Tend and Befriend" model of the female stress response.[164,165] This model suggests that under conditions of stress women are likely to increase their support-seeking behaviors from others, including significant others. This support seeking (also called affiliation behavior) may help reduce women's feelings of stress. Research the female neuroendocrine response to stress suggests that after the initial fight or flight response to stress, the release of oxytocin ("the love drug") is greater among females than males.[165] The increase in

oxytocin may enhance affiliation behavior, reduce feelings of stress among women and ultimately lead to better birth outcomes. On the other hand, this affiliation behavior may increase her partner's stress as she leans on him for support.

Figure V-1 is a depiction of an alternative conceptual model of how maternal and paternal stressors are associated with birth outcomes based upon the "Tend and Befriend" model of the stress response among women. The paths depicted in Figure V-1 may explain the positive effect of paternal stress on birth outcomes. Under conditions of stress, expectant mothers may seek support from the father of their baby, which may cause him additional stress, but alleviate some of her stress, which would ultimately lead to better birth outcomes.

Figure V-1. Conceptual model of the positive effect of paternal stress on birth outcomes based on the "tend and befriend"[164] model of the maternal stress response.

The third paper in this dissertation found that experiences of several domains of stress were associated with greater health risk behaviors and outcomes, including substance use, conduct problems, unprotected sex and depressive symptoms, among young expectant couples. This finding concurs with vast previous research demonstrating the same effect among adolescents.[143,173–179,182,183,191–194,218–221] The results from this analysis contradicted my hypothesis that a partner's experience of stress could crossover and negatively affect one's own health and health behaviors, based on stress and strain crossover theory.[222] The results showed that all of the significant effects of the young men's partner's stress were associated with *less* risk behavior and *more* protective behavior. This analysis also found that young men's depressive symptoms were directly associated with his partner's personal hardship

stressors, a finding that is consistent with the theory of empathetic distress in which one partner takes on the experiences of stress and distressed emotions experiences it as one's own."[199] For all the negative portrayal of young expectant women's partners, the results of this analysis suggest that young men who see that their partner is under significant stress, may empathize with their partner's troubles and may improve their health behaviors for the benefit of their partner and their new baby.

Key Finding #1: Father's experiences matter to the health of the unborn child

Together, the findings from this dissertation research suggest that father's experiences during his partner's pregnancy matter to the health of an unborn child. Over the past decade there has been increasing focus on supporting father involvement in order to promote child health and wellness, and a new call to promote investigation into paternal effects on birth outcomes[67,223,224] and paternal involvement during the perinatal period.[224,225] For example, the National Healthy Start Initiative, whose mission is to advocate "for health equity, services, and interventions that improve birth outcomes and family wellbeing," has focused in recent years on ensuring inclusion of fathers in their programs and promoting research that examines the impact of father involvement on birth outcomes and child health.[224]

Many studies have found evidence that father involvement is associated with birth outcomes.[68,102,217,226] This dissertation research went beyond prior studies that have assessed father involvement by maternal report of father's behavior (such as his financial contributions or other support or whether the father's name is birth certificate). This dissertation research treated men's experiences during pregnancy, including experiences of stress and relationship quality, with equal weight to women's experiences when it came to their impact on birth outcomes. The findings from this research suggest that men's experiences during the transition to parenthood are associated with birth

outcomes—in some circumstances with positive effects and others with negative effects. The sizes of the effects of paternal experiences during his partner's pregnancy were not negligible, either. This research found that babies born to men who reported the highest level of conflict were nearly 70 grams lighter at birth than babies born to fathers who reported the lowest level of conflict. Additionally, babies born to fathers that were not present at their child's birth were nearly 99 grams lighter at birth. Paternal stress was not associated with birth outcomes in the expected negative direction among young couples. Babies born to fathers with the highest levels of paternal stress weighed, on average, over 113 grams *heavier* at birth than babies born to fathers with the lowest level of stress. The average negative effect of *light* smoking during pregnancy in birth weight is 160 grams,[130] which demonstrates that the effect sizes found in these analyses are meaningful. The stress and coping framework[227] as well as the stress and strain crossover theory[222] both suggest that experiences of stress should have been negatively associated with health generally, and birth outcomes in particular. The positive effect of men's stress on birth outcomes coupled with the lack of effect of maternal stress on birth outcomes, however, suggests that there may be an alternative model for how parental stress processes among expectant couples influence birth outcomes. The "Tend and Befriend"[164] model of the female stress response may better fit the findings in this dissertation. This model of the stress response suggests that under conditions of stress, women are more likely than men to affiliate with others and seek social support. Men are more likely to display behaviors that are fightor-flight related in response to stress, such as substance use. In fact, the final paper in this dissertation found that association of experiences of stress with substance use were much more common among expectant fathers than mothers. Under conditions of stress, the expectant mothers in this study may have sought out substantial support from the father of their baby, which may have benefitted her wellbeing and ultimately the baby's health. This support seeking, however, may have come at the cost of increasing her partner's stress as she leaned on

him for support. While support seeking was not measured in the dataset used for this analysis, post-hoc analyses did find that women's stress was significantly associated with her attachment anxiety, which was in turn significantly correlated with her partner's stress.

It is noteworthy that the effects of father's report of relationship quality and his involvement among men in the Fragile Families population were in the expected direction: babies born to father's who reported the highest level of relationship conflict were born earlier and smaller, and babies born to fathers who were present at the birth were born later and bigger. Men in the Fragile Families study were generally older (average age was 29.7) and weighting of the dataset made the data representative of births to married and unmarried couples in large U.S. cities. The effects of father's reports of stress among men in the PARTNRS study were in an unexpected direction: greater stress was related to longer gestation and greater birth weight. Men in this study were younger (average age was 21.3) and were unmarried. It may be that young unmarried men who are expecting a baby are less equipped developmentally to deal with the stress of the pregnancy and his partner's support needs compared to older men. Young men who report the most stress may be providing the most support for his expectant partner, which may be indicative of a healthier and more committed relationship (which would ultimately support a healthier pregnancy) than young men who are less engaged and less stressed as a result. Older men who have had many more years to develop psychosocial skills may be less stressed than younger men by the support needs of his expectant partner. The stress that an older man reports about a relationship may be indicative of the most unhealthy relationships, which would lead to a less healthy pregnancy and more negative birth outcomes.

Key Finding #2: Parental relationships are associated with birth outcomes

Relationship quality has been associated with a variety of health outcomes, including cardiovascular disease,[99] inflammation[100] and impaired immune function.[100] The findings from this dissertation concur with previous research demonstrating that relationships can influence health by buffering, causing or exacerbating stress.[211] In addition, the findings extend the literature by demonstrating that relationship quality was associated with birth outcomes among a national sample of married and unmarried couples. This research showed that relationship dynamics that caused or exacerbated stress—notably couple conflict—were negatively associated with birth outcomes. Further, a marker of relationship quality and paternal support and involvement—whether the father's name was on the baby's birth certificate—was also positively associated with birth outcomes at a level that was nearly commensurate with the effect of light smoking on birth outcomes.

This research also found that there was an interactive effect of parental reports of relationship conflict on birth outcomes: the average birth weight was the lowest when both parents reported high levels of conflict with their partner. The results also showed that the mother's report of conflict was protective—when mothers perceived low levels of conflict, the father's report of conflict did not have an effect on birth weight; however, when mothers reported high levels of conflict, the greater the father's the report of conflict the worse it was for the baby. Our nation has spent the last several decades focusing on changing *maternal* behaviors during pregnancy (e.g. smoking during pregnancy and attending prenatal care) to improve population rates of low birth weight and preterm birth with little luck. This research suggests that the parental relationship and the experiences of both partners during the pregnancy have unique and important contributions to poor birth outcomes. Programs and policies that not only address the importance of healthy romantic relationships, but that also include both members of an expectant couple, may help support healthier pregnancies and lead to better birth

outcomes.

Key Finding #3: Young expectant couples experience high levels of stress in their lives

There has been very little research exploring young expectant adolescents' experiences of stress during pregnancy. In fact, young expectant fathers' experiences in general during his partner's pregnancy have largely been ignored, despite the fact that his partner's pregnancy is also a major life transition for him. As if the transitions to adulthood and parenthood were not stressful enough in and of themselves, the young couples from the PARTNRS study also reported experiencing many stressors during the pregnancy, ranging from individual experiences (e.g. job loss), interpersonal exposures (e.g. conflict in a steady relationship), neighborhood conditions (e.g. crime in neighborhood), to societal context (e.g. racism).

Nearly half of all PARTNRS women and men reported problems with money in the previous 6 months, and one-third of the young men reported being unemployed as a stressor. Over one-third of the young women reported moving within the previous six months. In a post-hoc analysis of the PARTNRS data, over 75% of the young men and women experienced at least one (out of eleven) stressful life events in the previous 6 months. Seventy-nine percent of young men and women reported experiencing discrimination in their daily lives. Over 78% of men and 75% of young women reported at least one minor or serious neighborhood problem (out of fifteen), including assault and muggings and feeling unsafe after dark.

When developing and implementing programs and policies that may help improve relationships and mitigate stress during pregnancy, practitioners must always consider that the main focus of the program maybe not ultimately be the main stressor or focal point in the participants' lives. Adolescents and young adults who are racial and/or ethnic minorities, live in urban areas and are from a low socioeconomic status (SES), are disproportionately affected by severe and chronic stressors, such as financial stressors, neighborhood problems, racism and discrimination.[38] Programs and policies that fail

to address these fundamental issues may not see success in improving outcomes because they fail to incorporate what may be the main drivers of the outcomes in the first place. Even worse, programs and policies that do not address these fundamental issues may inadvertently cause unexpected negative outcomes.

Key Strengths

While there is substantial previous research exploring the effect of maternal stress on birth outcomes, this dissertation was the first to explore the effect of *paternal* stress on birth outcomes, and the pathways through which he has an effect. This analysis assessed direct report of stress exposures and responses from the fathers, avoiding measurement error associated with using maternal reports of paternal experiences. This analysis also explored multiple sources of stress in an effort to parcel out which stressors had an effect on birth outcomes. This analysis was also the first to explore how multiple dimensions of relationship quality, beyond more crude measures such as marital status, affect birth outcomes among married and unmarried families.

The analytical techniques used in this research also strengthened the analyses. Each analysis accounted for the correlated nature of maternal and paternal reports, while maintaining the strength of the total sample size (i.e. without conducting the analyses separately by gender). In addition, one of the analyses used structural equation modeling, which allowed for the simultaneous assessment of multiple hypotheses involving complex pathways, while parceling out measurement error. Another analysis employed multilevel modeling (with the Actor Partner Interdependence Model[210] as a framework), which used a single analysis to incorporate responses from both members of a couple and treated the members of a couple as nested scores within the same group.

Key Limitations and Suggestions for Future Research

While this dissertation has many strengths, it is not without limitation. Because the analyses were all secondary, I was limited by the study design and the measures collected for both datasets (Fragile Families and PARTNRS). Neither study was nationally representative, although the Fragile Families study was a national sample that was representative of births in large U.S. cities. Therefore, the ability to generalize the findings may be limited to the populations studied.

Additionally, issues related to the timing of assessments were of concern in all analyses. In the Fragile Families study, parents' report of their relationship quality was assessed shortly after the birth of the baby, raising concern over the issue of reverse causality. For example, a poor birth outcome (having the baby earlier than 38 weeks) may cause parents stress, which may cause them to think and report more negatively about their relationship over the final month of pregnancy. In the PARTNRS study, experiences of stress and depressive symptoms were assessed at the same time point, limiting our ability to establish directionality in the analysis of whether depressive symptoms mediated the effect of stress on birth outcomes. These paths are guided by theory, however, and the time frames referenced by each measure make the direction of the effects plausible. The PARTNRS study, however, allowed for longitudinal assessment of the effects of stress on birth outcomes because the birth outcomes were collected from medical records, while the self-report of stress were ascertained during the second and third trimesters of pregnancy.

Another limitation is that the studies did not collect data on stress appraisal and perception. Future studies would be strengthened by the inclusion of stress appraisals and perceptions. What is stressful for one person may not be stressful for another, and therefore the likelihood of reporting a stressful event may be affected by an individual's appraisal of the stressor.[69] Measures of stress appraisals and perceptions could ascertain the individual's perception and evaluation of potential harm

posed by a specific external demand (i.e. stressor) and their ability to cope with the demand.[70] The inclusion of biological indicators of stress responses may also help show whether a stressor actually has a physiological effect on the expectant mother that could ultimately affect the health and development of the fetus.[14]

Another concern is whether there are important omitted variables that could explain the association between relationship quality and stress, with the birth outcomes. Unfortunately, due the limitations of the study designs and measures collected, we cannot separate out unmeasured confounding of the association between relationship quality and stressors with birth outcomes by some other parental characteristic (e.g. personality, depression) that would affect both the report of exposures and outcome. Given the substantial evidence that has documented an association between relationships quality and general health,[(e.g. 62,99,100)] and stress and birth outcomes[(e.g. 27,28,31–34,43)] the results from this this study are plausible; however, future studies that are longitudinal and collect measures of these other characteristics would strengthen the validity of the findings.

Implications for Future Research, Programs and Policies

Despite the importance of male partners during pregnancy, very little research has explored paternal influences on birth outcomes.[37] Research examining the effects of paternal factors on birth outcomes has been mostly limited to demographic factors (e.g. advanced age, race/ethnicity, etc.) and maternal reports of paternal involvement and support, and these measures are often crude (e.g. father's name on birth certificate).[68,217] Researchers and clinicians have almost entirely focused on how women's experiences, behaviors, and physical and mental health are associated with birth outcomes. This lack of inclusion of men in research during the antenatal period is reflective of the gender biases

that are evident in mainstream American culture and parenting norms.[228] American culture largely views pregnancy and child care as a women's responsibility.[228] As such, programs and policies are almost entirely focused on improving women's health and behaviors during pregnancy, with the female as the sole recipient of the intervention or target of the policy. By continuing to focus birth outcome research on women only, we may be inadvertently perpetuating this construction of pregnancy and child health as a largely maternal responsibility, while men are seen (and treated) as unimportant in their capacity to influence the health of their unborn child.[228] The results of this research demonstrate that men's experiences during pregnancy are important (and substantial) predictors of birth outcomes. As such, future research studies that investigate psychosocial influences on birth outcomes should include both maternal and paternal experiences.

Future investigations would be strengthened by inclusion of direct report from the expectant fathers so as to reduce measurement error associated with maternal report of paternal factors. Obtaining direct report from fathers may not be easy due to existing barriers to paternal engagement during the prenatal period. Due to cultural, institutional and policy biases around maternity care, men are marginalized at the outset of the prenatal period. Thus, future studies need to recruit men directly, not just through the mothers, and offer flexible hours or home visits for their participation in the research. Further, welcoming the expectant fathers personally and communicating the potential advances that may result from the fathers' participation in the research may go a long way in successful recruitment and retention of expectant fathers. The PARTNRS and Fragile Families studies used these strategies to maximize the engagement of the expectant and new fathers with great success.

Additionally, there should be parity in the data collected from expectant mothers and fathers (i.e. the same questions are asked of both parents), which would allow for the use of dyadic data

analysis methods, such as those employed in this dissertation. Dyadic data analysis methods can help parcel out the maternal, paternal and couple level effects on birth outcomes.

Because relationships, stress, mental health and other psychosocial factors are inherently affected by significant others, programs to improve birth outcomes and early child health that target only the expectant mother seem unlikely to be effective or effect change that is sustainable. Couplesbased programs to improve birth outcomes may be more effective than programs that include mothers only. There has been very little investigation into the effectiveness of couples-based interventions on improving birth outcomes. The Family Foundations' couples-based intervention for expectant parents is the only intervention, to my knowledge, that has been evaluated in its effectiveness in improving birth outcomes. Family Foundations is delivered in a group format and aims to provide psychosocial support and education, with the goal of preparing couples to enter parenthood together in a supportive manner.[229] When evaluated, Feinberg et. Al. (2015) found that among women with the highest levels of cortisol, the Family Foundation intervention reduced the incidence of adverse birth outcomes, including preterm birth and low birth weight.[229] The development and evaluation of theory- and evidence-based couples interventions may help improve the rates of adverse birth outcomes in the future.

Appendices

Appendix II-1. Variable descriptions and details.

Construct	Measure and Reference	Description	Response Scale	Time Points Assessed	Time Frame Referenced	Summary Measure
Exposures: Relationship Quality						
Positive Couple Activities	Original to Fragile Families	4 items asked whether they had done positive activities with baby's father/mother (e.g. went out to a movie, helped each other solve a problem)	1=Yes 0=No	Baseline	Last month	-Responses summed to form an index -Higher scores correspond to more positive activities (range: 0-4) (α=0.64 w, 0.60 m)
Couple Conflict	Adapted from National Survey of Family Health[121]	6 items assessed frequency of disagreements about specific topics (e.g. money, sex, being faithful)	1= never 2= sometimes 3= often	Baseline	Last month	-Responses summed to form a continuous scale -Higher scores correspond to more disagreement/more conflict (range: 6-18) (α=0.65 w, 0.64 m)
Partner Support	Adapted from Multidimensional Support Scale (MDSS)[122,123] and Susan Loyd's Effects of Violence on Work and Family project.	4 items assessed frequency of supportive and destructive behavior toward respondent by the baby's father/mother (e.g., s/he is fair and willing to compromise, s/he insults or criticizes you or your ideas)	1= often 2= sometimes 3= never	Baseline	Current	-Responses summed to form a continuous scale -Supportive behaviors were reverse scored. -Higher scores correspond to more partner support (range: 4-12) (α=0.60w, 0.59 m)
Relationship Satisfaction	Original to Fragile Families	6 items ask how life might be different if they were married to the baby's father/mother (for unmarried) or not married to the baby's father/mother (for married) (e.g. financial security, happiness)	4-point scale ranging from 5=much worse to 1=much better	Baseline	Current	-Responses summed to form a continuous scale -Responses from unmarried respondents were reverse scored. -Higher scores correspond to more partner/relationship satisfaction (range: 6-30) (α=0.72 w,0 .67m)

BF present at birth	--	Asked baby's father whether he was present at the birth	1=Yes 0=No	Baseline	--	Dichotomous

Relationship Duration	--	Asked mothers years and/or months they knew the baby's father before the pregnancy	Months	Baseline	--	Continuous (range: 0-432)
Birth Outcomes						
Birth Weight	Weight at birth	--	Grams	Medical Records	--	Continuous (range : 470-5,585)
Gestational Age at Birth	Weeks pregnant at birth	--	Weeks	Medical Records	--	Continuous (range: 23-46)
Effect Measure Modifier						
Marital Status	--	Asked whether currently married to father of the baby	1=Yes 2=No	Baseline	Current	Dichotomous
Confounders (Maternal and Paternal)						
Age	--	Summary variable created by FF from birth date.	--	Baseline	Current	Continuous (range:15-43 women 15-53 men)
Household Income	--	Asks: "Thinking about your income and the income of everyone else who lives with you, what was your total household income before taxes in the past 12 months?"	1= < $5,000 2= $5,000 to $9,999 3= $10,000 to $14,999 4= $15,000 to $19,999 5= $20,000 to $24,999 6= $25,000 to $34,999 7= $35,000 to $49,999 8= $50,000 to $74,999 9= > $75,000	Baseline	Current	Categorical

Education	--	Asks the highest grade or year of regular school that they have completed.	1= < high school 2= high school/equiv 3= some coll, tech 4= coll or grad	Baseline	Current	Categorical
Race/Ethnicity	--	Asks which category best describes their race and ethnicity.	1= White 2= Black 3= Hispanic 4= Other	Baseline	Current	Categorical
MATERNAL ONLY						
Parity	--	From medical record *before* the index child was born.	--	Baseline & Medical Records	Current	Continuous (range: 0-12)
Paid for birth with	--	Payment for delivery	1=Yes	Medical Records	--	Dichotomous
Medicaid or was uninsured		indicated as Medicaid, partial Medicaid, Uninsured or other government program	0=No			
Smoking During Pregnancy	--	Mother smoked cigarettes during pregnancy, from all possible sources in the medical record	1=Yes 0=No	Medical Records	During Pregnancy	Dichotomous
Drug Use During Pregnancy	--	Mother used drugs during pregnancy, from all possible sources in the medical record	1=Yes 0=No	Medical Records	During Pregnancy	Dichotomous
Alcohol Use During Pregnancy	--	Mother used alcohol during pregnancy, from all possible sources in the medical record	1=Yes 0=No	Medical Records	During Pregnancy	Dichotomous

Time between Mother and Father Interviews	--	Days between parental interviews	Days	Baseline	After Delivery	Continuous (range: 0-32)

Appendix II-2. Measure details, validity and reliability

The following summary variables were created using items from the Fragile Families and Child Well Being Study Baseline Survey of Parents.[230]

Positive Couple Activities

The following 4 items comprising the positive couple activities measure were developed for the Fragile Families study. The 4 questions listed below asked parents whether they had done positive activities with the baby's father/mother in the last month or the last month they were together (1=Yes, 0=No). A total positive couple behavior score was created by summing the responses (α =0.64 mothers and 0.60 fathers; range 0-4).

> *I'm going to read you some things that couples often do together. Tell me which ones you and [BABY'S FATHER/MOTHER] have done together in the past month*
>
> 1. *visited with friends*
> 2. *went out to a movie, sporting event, or some other entertainment*
> 3. *ate out in a restaurant*
> 4. *helped each other solve a problem*

No specific validity information is provided by the principal investigators; however, this measure has been successfully employed as an indicator of relationship quality using Fragile Families data. A study among adolescents and young adults in the Fragile Families study used the four items assessing joint participation in activities together (KR20=.67 for fathers; KR20=.74 for mothers). More positive couple activities reported by the mother predicted more father involvement 3 years later.[231]

Couple Conflict

This measure was loosely adapted from the National Survey of Family Health.[121] Questions asked parents how often they had disagreements about six topics listed below. Parents responded on a

three point scale ranging from 3=often, 2=sometimes, 1=never. Responses were summed to form a continuous score, with higher scores indicating less conflict and more agreement in the relationship (chronbach's α= 0.65 mothers and 0.64 fathers; range 6-18).

> *The following is a list of subjects on which couples often have disagreements. How often, if at all, in the last month have you and [BABY'S FATHER/MOTHER] had disagreements about each of the following:*
>
> 1. *money*
> 2. *spending time together*
> 3. *sex*
> 4. *the pregnancy*
> 5. *drinking or drug use*
> 6. *being faithful*

Results of formal tests of the measure's validity have not been reported, however, several analyses of Fragile Families data have used this measure as an indicator of relationship quality. A study assessing relationship conflict and union formation used the 6 items about relationship conflict. The frequency of conflict was represented by the mean of parents' reports about whether they "never" (1), "sometimes" (2), or "often" (3) had conflict over the six items in the last month. Reports of conflict had inconsistent effects. Only father's reports of conflict significantly deterred cohabitation.[232] No chronbach's alpha was reported.

Another study found that couple conflict measured using maternal report of these items (chronbach's α =0.65) predicted poor maternal prenatal health behaviors.[233] A study among adolescents and young adults in the FF study used conflict items (α =0.64 mothers and 0.62 fathers) to predict father involvement. Disagreements reported by both mothers and fathers were not significantly associated with father involvement 3 years later.[231]

Partner Support

This measure was loosely adapted from the Winefield et al. Multi-Dimensional Support Scale (MDSS; 1992).[122,123] Five questions asked parents how often the mother or father of their baby displayed supportive or destructive behavior toward the respondent. Parents responded on a three point scale ranging from 1=often, 2=sometimes, 3=never about the items listed below. Support (positive) behaviors were reverse-scored when creating a total score, which summed the responses. Higher scores indicate more supportive and less destructive behaviors toward the respondent. Factor analysis using maximum likelihood indicated that the "s/he hits or slaps you when angry" item did not load above 0.32 (standard threshold)[234] on to the partner support factor. Therefore, this item was excluded and a four-item variable using the other items was created (α =0.60 mothers and 0.59 fathers; range 4-12).

Thinking about your relationship with [BABY'S FATHER/MOTHER], how often would you say that:

1. *s/he is fair and willing to compromise when you have a disagreement*
2. *s/he hits or slaps you when angry (*not include in summary variable)
3. *s/he expresses affection or love for you*
4. *s/he insults or criticizes you or your ideas*
5. *s/he encourages or helps you do things that are important to you*

Alpha coefficients are generally high for the MDSS (>.75) and the subscale scores correlate well with affect measures (e.g. depressive affect, self-esteem, psychological disturbance).[123]

Several analyses of Fragile Families data have used this measure, in different forms, as an indicator of relationship quality. A 9-item version was used 1 year postpartum among Fragile Families Fathers. These 9 items included the 5 items assessed at baseline. The author dichotomized the

outcome (sometime and often vs. never). Chronbach's α was 0.90 for married fathers and 0.93 for unmarried fathers. Relationship quality predicted perceptions of co-parental support for married fathers but not unmarried fathers.[235]

A 6-item version (which included the 5 items included in this analysis) was used 1 year postpartum among Fragile Families mothers and fathers. Authors averaged the scores for mothers and fathers (chronbach's α =0.76). Better relationship quality predicted greater parental engagement in infant and toddler years, with married and cohabiting couples similar in the association.[236]

A 4 item version ("insults or criticizes you or your ideas,""expresses affection or love for you," "is fair and willing to compromise," and "encourages and helps you to do things.") using baseline assessments from all mothers significantly predicted (chronbach's α =0.66) breastfeeding rates only among African Americans.[237]

Relationship Satisfaction

The items for this measure were developed specifically for the Fragile Families Study. The six items ask how life might be different if they were married to the baby's father/mother (for unmarried couples) or *not* married to the baby's father/mother for the married couples). Couples reported responses to the following items on a scale from 1=much better to 5=much worse. The responses for unmarried respondents were reverse scored with the theory that if they rated that the items would be worse with marriage, they were demonstrating a lack of satisfaction with their partner and/or relationship. Coding for responses for married respondents were maintained because if they rated that the items would be much worse if they were not married to the baby's father/mother, it shows they are more satisfied with their partner and/or relationship. A total relationship status satisfaction score was created by summing the responses. Higher scores indicate more satisfaction with their partner and/or relationship (α =0.72 mothers and 0.67 fathers; range 6-30).

If you were/were not married, how would life be different in terms of:

1. *financial security*
2. *overall happiness*
3. *freedom to do what you want*
4. *control over money*
5. *sex life*
6. *relations with parents*

No Fragile Families analyses to my knowledge have used these questions as a summary measure representing relationship quality. Therefore, this dissertation is a novel use of these questions as a representation of relationship quality.

Appendix III-1. Outcome and confounder descriptions and details

Construct	Measure	Description	Response Scale	Time Points Assessed	Time Frame Referenced	Summary Measure
Birth Outcomes						
Birth Weight	Weight at birth in grams	--	--	At birth via labor log	--	Continuous
Gestational Age at Birth	Weeks pregnant at birth	--	--	At birth via labor log	--	Continuous
Mediator						
Depressive Symptoms	Center of Epidemiological Studies-Depression Scale (CES-D)[91] (adapted)	15 items assessed how often experienced the depressive feeling or thought (e.g. I felt depressed, had crying spells) - Five behavioral manifestations of depression items were removed	4-point scale ranging from 0 ("Rarely or none of the time (less than 1 day") to 3 ("Most of the time (5-7 days)")	Base (24-40 weeks pregnant)	Past Week	-Responses summed to form a continuous scale - Higher scores correspond to more depressive symptoms (range: 0-45) ($\alpha = 0.84$, $\alpha = 0.78$ m)
Confounders (Maternal and Paternal)						
Age	--	Summary variable created by from birth date.	--	Baseline	Current	Continuous

Household Income	--	Asks: " What is your household income (the total income before taxes earned by all members of your household) per year)	0 $0-$4,999 1 $5,000-$9,999 2 $10,000-$14,999 3 $15,000-$19,999 4 $20,000-$24,999 5 $25,000-$34,999 6 $35,000-$49,999 7 $50,000 or more	Baseline	Current	Categorical

BMI pre-pregnancy	--	Calculated from participant report of pre-pregnancy weight and current height.	--	Baseline	Pre-Pregnancy	Continuous
Baby's Gender	--	--	1=Male 2=Female	At birth via labor log	--	Dichotomous

Appendix III-2. Variable details, items, validity and reliability

Stressful Life Events

This 11-item scale was adapted from the 12-item Life Events Scale, which was created by Brugha and Cragg (1990).[151] This scale asks participants if they have experienced stressful life events in the previous 6 months. Ten items out of the original 12-items were incorporated into the questionnaire, however, three original items were revised: "You became unemployed or you were seeking work unsuccessfully for more than one month" was changed to "In the past 6 months, did you become unemployed or were seeking work unsuccessfully," "You had a major financial crisis" was changed to simply "In the past 6 months, did you have money problems," and "You had problems with the police and a court appearance" was changed to "In the past 6 months, did you have problems with the police." Additionally, two questions were combined and changed into one question: "Your parent, child or spouse died" and "A close family friend or another relative (aunt, cousin, grandparent) died" were combined and shortened into "In the past 6 months, did a close family member or friend die."

Additionally two items were added for the research study including: "In the past 6 months, did you have problems at work or school," and "In the past 6 months have you moved." Two of the original items from the LEQ were also omitted from the research study including: "You had a separation due to marital difficulties" and "You were sacked from your job." The 11 items were summed to form a total score.

The test-retest reliability of the Life Events Scale is reported as .84 for a three-month period and .66 for a six-month period. Data on internal consistency are not available. Concurrent validity estimates were derived from the concordance between inpatient psychotic patients' identification of stressful events and those identified by a significant other; there was a 90% agreement when assessed at a threemonth period and a 70% agreement when assessed at six months. The authors also used an extensive interview of stressful events as a base rate and showed that the LEQ was sensitive to the identification of stressful events.[151]

Items:

In the past 6 months: have you suffered a serious illness, injury, or assault? did a close relative suffered a serious illness, injury, or assault?
did a close family member or friend die?
you break off a steady relationship?
did you have a serious problem with a close friend, neighbor, or relative?
did you become unemployed or were seeking work unsuccessfully? did you have money problems? did you have problems with the police? did you have problems at work or school? was something you valued was lost or stolen? have you moved?

General Discrimination

An adapted version of the Daily Life Experiences Scale was used to assess participant experiences of discrimination.[152] The original Daily Life Experiences Scale has 20-items, however the adapted version used 19 of those items. The items how often the survey taker has experienced discrimination (e.g. Being observed or followed in public places). The response scale ranged from 0 to 5:

0= “never,” 1= “less than once a year,” 2= “a few times a year,” 3= “about once a month,” 4= “a few times a month,” and 5 = “once a week or more.” Responses to items were summed to form a total score ranging from 0-95.

Four items from the original scale were also revised, including “Being mistaken for someone else of your same race (who may not look like you at all)” was changed to “mistaken for someone else (who may not look like you at all)” and “Being asked to speak for or represent your entire racial/ethnic group (e.g. What do ___people think?)” was changed to “asked to speak for or represent an entire group (e.g.
What do ___people think?), “Overhearing or being told an offensive joke or comment” was changed to “hear an offensive joke or comment” and “Being avoided, others moving away from you physically” was changed to “avoided, or do others move away from you physically.” There was also one item added: “Someone in the health system showed you hostility or a lack of respect, refused you service or paid less attention to you compared with others” and one item was omitted “Being considered fascinating or exotic by others.”

Items

In general, how often are you ignored, overlooked, or not given service (in a restaurant, store, etc.)?
In general, how often are you treated rudely or disrespectfully?
In general, how often are you accused of something or treated suspiciously?
In general, how often are you do others react to you as if they were afraid or intimidated?
In general, how often are you observed or followed while in public places?
In general, how often are you treated as if you were "stupid", being "talked down to"?
In general, how often are your ideas or opinions minimized, ignored, or devalued?
In general, how often do you hear an offensive joke or comment?
In general, how often are you insulted, called a name, or harassed?
In general, how often do others expect your work to be inferior?
In general, how often are you not taken seriously?
In general, how often are you left out of conversations or activities?
In general, how often are you treated in an "overly" friendly or superficial way?
In general, how often are you avoided, or do others move away from you physically?
In general, how often are you mistaken for someone who serves others (i.e., janitor, bed boy, maid)?
In general, how often are you stared at by strangers?
In general, how often are you laughed at, made fun of, or taunted?
In general, how often are mistaken for someone else (who may not look like you at all)?
In general, how often are you asked to speak for or represent an entire group (e.g., "What do _____ people think?")?
In general, how often has someone in the health system showed you hostility or a lack of respect, refused you service or paid less attention to you compared with others?

Perceived Stress

This 10-item Perceived Stress Scale (PSS) assessed the degree to which individuals perceive situations in their lives to be stressful.[87] The items focused on how unpredictable, uncontrollable, and overloaded individuals perceive their lives to be. The participant was asked to rate the perceived level of stress in their life during the past month (e.g., “How often have you felt: upset by something that

happened unexpectedly, able to control irritations in your way, and on top of things"). Possible responses ranged from 0 to 4, with 0 = "never," 1 = "almost never," 2 = "sometimes," 3 = "fairly often," to 4 = "very often." Positive items were reverse-scored. Items were summed to form a total score ranging from 0 to 40, with higher scores corresponding to greater perceived stress.

Early studies found that the 14-item measure has good psychometric properties. For example, Cohen and colleagues (1983) reported coefficient alpha reliabilities of .84, .85, and .86 across two samples of college students and a community smoking cessation group.

Early studies also found that the PSS was moderately related to responses on other measures of appraised stress, as well as to measures of potential sources of stress as assessed by event frequency. Studies also found that the PSS provided better predictions for individual behavior than did life-event scales of psychological symptoms, physical symptoms, and utilization of health services. Because levels of perceived stress should be influenced by daily hassles, the predictive validity of the PSS is expected to fall off rapidly after four to eight weeks.[87]

Items

In the past month, how often have you felt…

Upset by something that happened unexpectedly?
Unable to control important things in your life?
Nervous and stressed?
Confident in your ability to handle your personal problems? r
That things were going your way?r
Unable to cope with all of the things you had to do?
Able to control irritations in your life? r
On top of things? r
Angry because of things that happened that you couldn't control?
That difficulties were piling up so high that you couldn't overcome them

r=reverse coded

Depressive Symptoms

Fifteen items were adapted from the 20-item Center for Epidemiologic Studies Depression Scale (CES-D), which was developed by Radloff (1977).[91] The items address whether the participant felt or exhibited the behavior of the major components of depression in the previous week (e.g. I felt that everything I did was an effort). As the original CES-D scale specified, participants were asked to respond using: 0= "rarely or none of the time (less than 1 day)," 1= "some or a little of the time (1-2 days)," 2 = "Occasionally or a moderate amount of the time (3-4 days)," and "Most or all of the time (5-7 days)." The five behavioral manifestations of depression items were removed, including item did not feel like eating, trouble keeping mind on what I was doing, everything I did was an effort, my sleep was restless, and could not get going.

The CES-D scale discriminates strongly between patient and general population groups, be sensitive to levels of severity of depressive symptomatology, and reflect improvements after psychiatric

treatment. In addition, it should correlate well with other scales designed to measure depression, and be related to a felt need for psychiatric services.[91]

The CES-D scale has been found to have high internal consistency (coefficient alpha =.85 in the general population and .90 in the patient sample); studies found that both inter-item and item-scale correlation were higher in the patient sample than in the population samples. The scale also has moderate test-retest reliability (r between .45 and .70). Test-retest correlation was higher for shorter time intervals.[91]

Items

During the past week…

I was bothered by things that usually don't bother me.
I felt I could not shake off the blues even with help from my family or friends.
I felt that I was just as good as other people.r I
felt depressed.
I felt hopeful about the future. r I
thought my life had been a failure.
I felt fearful.
I was happy. r
I talked less than usual.
I felt lonely.
People were unfriendly.
I enjoyed life. r I
had crying spells.
I felt sad.
I felt that people disliked me.

r=reverse coded

Stressful Life Events

This 11-item scale was adopted from the 12-item Life Events Scale, which was created by Brugha and Cragg (1990).[49] This scale asks participants if they have had stressful life events. 10-items out of the original 12-items were incorporated into the questionnaire, however, three original items were revised: "You became unemployed or you were seeking work unsuccessfully for more than one month" was changed to "In the past 6 months, did you become unemployed or were seeking work unsuccessfully," "You had a major financial crisis" was changed to simply "In the past 6 months, did you have money problems," and "You had problems with the police and a court appearance" was changed to "In the past 6 months, did you have problems with the police." Additionally, two questions were combined and changed into one question: "Your parent, child or spouse died" and "A close family friend or another relative (aunt, cousin, grandparent) died" were combined and shortened into "In the past 6 months, did a close family member or friend die."

Additionally 2-items were added for the research study including: "In the past 6 months, did you have problems at work or school," and "In the past 6 months have you moved." Two of the original items from the LEQ were also omitted from the research study including: "You had a separation due to marital difficulties" and "You were sacked from your job."

The test-retest reliability of the Life Events Scale is reported as .84 for a three-month period and .66 for a six-month period. Data on internal consistency are not available. Concurrent validity estimates were derived from the concordance between inpatient psychotic patients' identification of stressful events and those identified by a significant other; there was a 90% agreement when assessed at a threemonth period and a 70% agreement when assessed at six months. The authors also used an extensive interview of stressful events as a base rate and showed that the LEQ was sensitive to the identification of stressful events.[49]

Two subscales were created for use in this study: **personal hardship stressors** and **close relationship stressors**. The items in each subscale are listed below.

Items:

In the past 6 months:

Personal hardship stressors

have you suffered a serious illness, injury, or assault? did you become unemployed or were seeking work unsuccessfully? did you have money problems? did you have problems with the police? did you have problems at work or school? was something you valued was lost or stolen?
have you moved?

Close relationship stressors did a close relative suffered a serious illness, injury, or assault? did a close family member or friend die? you break off a steady relationship? did you have a serious problem with a close friend, neighbor, or relative?

General Discrimination

An adapted version of the Daily Life Experiences Scale was used to assess participant experiences of discrimination.[50] The original Daily Life Experiences Scale has 20-items, however the adapted version used 19 of those items. The items how often the survey taker has experienced discrimination (e.g. Being

observed or followed in public places). The response scale ranged from 0 to 5: 0= “never,” 1= “less than once a year,” 2= “a few times a year,” 3= “about once a month,” 4= “a few times a month,” and 5 = “once a week or more.” Responses to items were summed to form a total score ranging from 0-95.

Four items from the original scale were also revised, including “Being mistaken for someone else of your same race (who may not look like you at all)” was changed to “mistaken for someone else (who may not look like you at all)” and “Being asked to speak for or represent your entire racial/ethnic group (e.g. What do ___people think?)” was changed to “asked to speak for or represent an entire group (e.g. What do ___people think?), “Overhearing or being told an offensive joke or comment” was changed to “hear an offensive joke or comment” and “Being avoided, others moving away from you physically” was changed to “avoided, or do others move away from you physically.” There was also one item added: “Someone in the health system showed you hostility or a lack of respect, refused you service or paid less attention to you compared with others” and one item was omitted “Being considered fascinating or exotic by others.”

Items

In general, how often are you ignored, overlooked, or not given service (in a restaurant, store, etc.)?
In general, how often are you treated rudely or disrespectfully?
In general, how often are you accused of something or treated suspiciously?
In general, how often are you do others react to you as if they were afraid or intimidated?
In general, how often are you observed or followed while in public places?
In general, how often are you treated as if you were "stupid", being "talked down to"?
In general, how often are your ideas or opinions minimized, ignored, or devalued?
In general, how often do you hear an offensive joke or comment?
In general, how often are you insulted, called a name, or harassed?
In general, how often do others expect your work to be inferior?
In general, how often are you not taken seriously?
In general, how often are you left out of conversations or activities?
In general, how often are you treated in an "overly" friendly or superficial way?
In general, how often are you avoided, or do others move away from you physically?
In general, how often are you mistaken for someone who serves others (i.e., janitor, bed boy, maid)?
In general, how often are you stared at by strangers?
In general, how often are you laughed at, made fun of, or taunted?
In general, how often are mistaken for someone else (who may not look like you at all)?
In general, how often are you asked to speak for or represent an entire group (e.g., "What do _____ people think?")?
In general, how often has someone in the health system showed you hostility or a lack of respect, refused you service or paid less attention to you compared with others?

Neighborhood Problems

This 15-item scale was adapted from the 13-item Perceived Neighborhood Problems Scale[207] in order to assess the participant's perception of their neighborhood’s quality. Two items were added to the original scale: “Feeling unsafe after dark” and “drugs.” Participants are asked to respond using the scale: 1 = "Not a problem," 2 = "Minor Problem," and 3 = "Serious Problem."

The 15 items were summed to form a total score.

Items

In your neighborhood, how much of a problem is….

Vandalism
Litter and rubbish
Assault and muggings
Disturbance by children or youngsters Speeding traffic
Nuisance from dogs
Reputation of neighborhood
Smells and fumes
Burglaries
Discarded needles and syringes
Uneven or dangerous pavements
Lack of safe places for children to play
Lack of recreational facilities
Feeling unsafe after dark
Drugs

Conduct Problems

Conduct problems were assessed by means of an adapted, 7-item version of the DSM Conduct Problems Scale.[209] Participants indicated how often they had various conduct problems in the previous 6 months on a 4-point scale ranging from 1= "5 or more times" to 4= "Not at all." The original DSM Conduct Problems Scale included 17 items and was based on the criteria for a DSM-III-R conduct disorder. The internal consistency of the items in the original scale among a sample of gay/bisexual youth was 0.74.[209] The 7 items were summed to form a total score.

Items

Please mark how often you have done the following in the last 6 months.

Skipped school or work?
Yelled at a friend or family member?
Got into an argument with others?
Got in a fight?
Said things that weren't true?
Stole something?
Been in trouble at school or work?

Depressive Symptoms

Fifteen items were adapted from the 20-item Center for Epidemiologic Studies Depression Scale (CES-D), which was developed by Radloff (1977).[51] The items address whether the participant felt or exhibited the behavior of the major components of depression in the previous week (e.g. I felt that everything I did was an effort). As the original CES-D scale specified, participants were asked to respond using: 0= "rarely or none of the time (less than 1 day)," 1= "some or a little of the time (1-2 days)," 2 = "Occasionally or a moderate amount of the time (3-4 days)," and "Most or all of the time (5-7 days)." The five behavioral manifestations of depression items were removed, including item did not feel like eating, trouble keeping mind on what I was doing, everything I did was an effort, my sleep was restless, and could not get going.

The CES-D scale discriminates strongly between patient and general population groups, be sensitive to levels of severity of depressive symptomatology, and reflect improvements after psychiatric treatment. In addition, it should correlate well with other scales designed to measure depression, and be related to a felt need for psychiatric services.[51]

The CES-D scale has been found to have high internal consistency (coefficient alpha =.85 in the general population and .90 in the patient sample); studies found that both inter-item and item-scale correlation were higher in the patient sample than in the population samples. The scale also has moderate test-retest reliability (r between .45 and .70). Test-retest correlation was higher for shorter time intervals.[51]

Items

During the past week…

I was bothered by things that usually don't bother me.
I felt I could not shake off the blues even with help from my family or friends.
I felt that I was just as good as other people.r I felt depressed.
I felt hopeful about the future. r I
thought my life had been a failure.
I felt fearful.
I was happy. r
I talked less than usual.
I felt lonely.
People were unfriendly.
I enjoyed life. r I
had crying spells.
I felt sad.
I felt that people disliked me.

r=reverse coded

a. Introduction

Preterm birth (PTB; <37 weeks gestation) and low birth weight (LBW; <2,500 grams) are among the leading causes of infant mortality in the United States (U.S.).[1] Furthermore, infants born preterm and/or with a low birth weight are at increased risk for behavioral and emotional problems during childhood, and chronic health conditions into adulthood, such as asthma, coronary artery disease and type II diabetes.[2,3] In the U.S., 11.~~3~~84% of infants are born preterm and 8.0~~2~~% are born with a low birth weight.[4] Beyond the implications for the child's health and development, the costs to the U.S. healthcare system associated with these birth outcomes are staggering. Medical care costs due to PTB alone exceeded $16.8 billion in the U.S. in 2005, a figure that does not include long-term productivity and educational costs to individuals and society as a whole.[5]

Every Healthy People initiative since the program's inception in the 1970s has included the goal of reducing the rates of LBW by improving the population rates of traditional risk factors, such as smoking during pregnancy and access to and use of prenatal care.[6–9] Over the last few decades there have been substantial improvements in the population rates of these traditional risk factors; however, the rates of PTB and LBW continue to remain high. For example, between 1990 and 2002, the rates of preterm birth and LBW in the U.S. each increased by about 15%,[10] while the rates of maternal smoking during pregnancy declined 38% during the same time period.[11] This evidence suggests that there are other factors, beyond traditional risk factors, that contribute to the risk for PTB and LBW.

Researchers have identified several psychosocial factors that have been linked to the risk for preterm birth and low birth weight, including level of social support.[12–14] Lack of social support during pregnancy has been related to stress and anxiety[12,15] and evidence shows that maternal stress during pregnancy is consistently predictive of negative birth outcomes, including PTB[13,16–19] and LBW.[16,17,20,21] For example, Feldman et al. (2000) demonstrated among a sample of 247 low obstetric risk women of mostly European or Hispanic ethnicity, that higher social support during pregnancy assessed at 28-30

weeks gestation, predicted higher infant birth weight adjusted for gestational age, marital status, education, ethnicity and obstetrical risk (adjusted B=0.15; P <0.05).[14]

Romantic relationships are a substantial source of social support as well as stress,[22] and have been shown to influence many health outcomes, including cardiovascular disease,[23] inflammation[24] and impaired immune function.[24] ~~During pregnancy, an expectant woman's relationship with the baby's father is most often an important social relationship.~~ While an increasing number of mothers are not married when their child is born, over 80% of unmarried women are in a relationship with the baby's father during pregnancy.[25] Thus, a woman's male partner—married or not—is usually an important social relationship during pregnancy and he likely has a substantial influence on the social wellbeing? Of an expectant mother during this time.

~~For example, r~~Research has shown that paternal support and involvement during pregnancy reduces the risk of negative birth outcomes.[26–29] Increased father support and involvement may influence birth outcomes by reducing maternal stress[16,30] and affecting pregnant women's health behaviors (e.g. smoking, attending prenatal care).[27,31,32] ~~Alio et al. reviewed~~A recent review of seven ~~published~~ studies ~~and~~ found that measures of paternal involvement ~~(measured in various ways across studies)~~ were~~as~~ consistently related to lower odds of LBW, the infant being small for gestational age (SGA) and more positive maternal prenatal health behaviors.[27] These studies ~~have~~ measured paternal support and involvement in ~~many~~ different ways, generally using crude proxies for involvement such as ~~;~~ ~~however, the measures were usually crude (e.g.~~ inclusion of father's name on birth certificate (add refs.) and whether the ~~-~~father contributes financially (add refs).

Paternal support is only part of how relationships can affect birth outcomes. Other dimensions of parental relationship quality, such as conflict, have the capacity to influence birth outcomes through their effects on maternal stress. ~~Cohen (2004)[22] describes how C~~conflict may cause psychological distress leading to negative health behaviors and/or physiological changes that increase disease risk,

Commented [HJ1]: Need the units to be able to interpret – would be better with 95% CIs

Commented [HJ2]: Which ones did they study?

while social support may buffer the effects of stress (Cohen, 2004). Little research, however, has explored if and how different dimensions of parental relationship quality during pregnancy affect birth outcomes. As described above, studies have focused on relationship characteristics that are easier to measure, such as marital status and whether the father's name was on the birth certificate. We know little about ~~*what* about~~the mechanism by which being married or having the baby's father's name on the birth certificate (beyond their associations with socioeconomic status) leads to better birth outcomes. Relationship quality is a multidimensional construct that includes dimensions such as support and conflict.[33,34] Sources of relationship support may include a partner's encouragement and willingness to compromise, while conflict may include disagreements about finances, spending time together and sexual relations. These dimensions may have unique associations with birth outcomes.

Furthermore, measures of relationship characteristics and paternal support are almost always reported in research studies solely by the mother. This approach is problematic for several reasons. First, asking mothers to report their partner's contributions or feelings may introduce~~s a level of~~ measurement error ~~that we are unable to determine~~as these are secondhand reports. Second, it ignores the possibility that fathers can have a unique and important effect on birth outcomes themselves, through their effects on maternal health and behaviors. Third, we are unable to assess whether there is an interactive effect of maternal and paternal reports of relationship quality on birth outcomes—for example, is having both parents report high levels of support from their partner much better than when only the mother reports high levels of support from her partner?

Commented [HJ3]: I don't understand this second point

In addition, we cannot assume that each facet of relationship quality affects birth outcomes the same way among couples in different types of relationships. Qualitative research has described how married couples perceive stress in relationships differently than unmarried couples. In one study by Waller,[35] when discussing tensions in their relationships, married couples perceived that conflicts were surmountable, while unmarried couples felt like the conflicts were risks to the stability of their

relationship.[35] Couple disagreements or conflict may lead to more stress among unmarried couples than among married couples, and thus the same conflicts may have a different effect on birth outcomes based on the couple's marital status.

Commented [HJ4]: Nice, solid introduction

The Current Study

This study uses data from both maternal and paternal reports among married and unmarried couples in the Fragile Families and Child Well-Being study to, first, explore whether multiple dimensions of parental relationship quality during pregnancy are associated with their baby's birth weight and gestational age at birth. I hypothesize that both maternal and paternal reports of fewer couple activities, more conflict, less partner support and less relationship satisfaction will be associated with lower birth weight and earlier gestational age at birth.

Second, this study aims to look at the interactive effect of maternal and paternal reports of relationship quality on these birth outcomes. I hypothesize that high levels of partner support, relationship satisfaction and couple activities when reported by both parents will have a greater positive effect on birth weight and gestational age than when the mother only reports high levels of these dimensions. I also hypothesize that high levels of couple conflict when reported by both parents will have a more negative effect on birth weight and gestational age than when the mother only reports high levels of couple conflict.

Commented [HJ5]: Another interesting possibility is that it is when there is disagreement between the two about the quality of the relationship, regardless of the direction that is harmful…

Third, this study aims to assess whether the association of parental relationship quality with birth outcomes differs among married and unmarried couples. I hypothesize that both maternal and paternal reports of couple activities, couple conflict, partner support and relationship satisfaction will have a greater effect on birth weight among unmarried couples than among married couples.

b. Methods

b.1 Data Source

Overview and Sampling

Data for the analyses come from the Fragile Families and Child Well-Being Study (hereon referred to as Fragile Families). IRB approval to use the de-identified Fragile Families survey and medical record data was obtained from the CUNY Graduate Center Human Research Protections Program. The Fragile Families and Child Well-Being Study is an ongoing longitudinal study following a national sample of new parents and their children born between the years 1998 and 2000. The study used a stratified random sample of cities with 200,000 or more people, with hospitals sampled within the cities and births sampled within the hospitals. The cities were stratified according to a scoring system that ~~took into~~ accounted for variability in the policy environments and labor market conditions within the cities. In several cities, births were sampled from all hospitals; in a few cities, hospitals were excluded for cost and efficiency reasons if the hospital had few births. In New York and Chicago, hospitals with over 1,000 non-marital births per year were randomly selected. Random samples of births were taken within each sampled hospital based on quotas that matched the percent of non-marital births in that city. Please see Reichman et al. (2001) for further details on the sampling strategy.[36]

Commented [HJ6]: Add a reference

~~*Subjects*~~*Participants*

Mothers were eligible if they were 18 years or older (in one-third of the hospitals, though, this restriction did not apply and some women under 18 were interviewed), spoke English or Spanish, were not too ill to participate, reported that the father of their new baby was living, were not planning adoption for the baby and the baby did not die before the interview could take place.

The analyses for this aim were based on the national sample of women having a singleton birth and the fathers of the index baby. Couples were included in the analysis if they were in a relationship

(reported that they were married, cohabiting or visiting), both the father and mother completed the survey and ~~either or both~~at least one outcome birth weight and/or gestational age data was available from the medical record abstraction (N=2622 for birth weight and 2637 for gestational age). Please see Figure II-1 below for the Data Selection Flow Chart. The data are representative of singleton births occurring in large (>200,000 people) U.S. cities.[36]

Commented [HJ7]: Nice figure – just make it clear how many of the ones with birthweight did not have gestational age (had birthweight only) and the same for EGA.

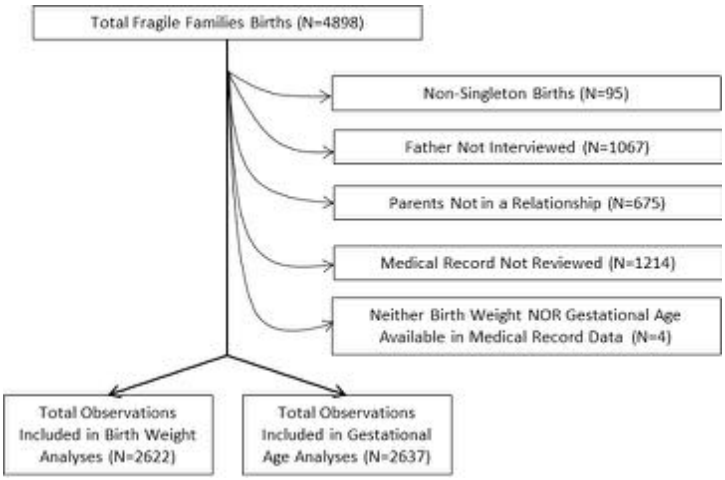

Figure II-1. Data Selection Flow Chart

Procedures

Parents completed baseline interviews in 75 hospitals or by phone in 20 cities across the U.S.generally within a few days ~~after their children were born~~of their child's birth. Mothers and 7~~5~~% of fathers were interviewed within 7 days ~~shortly after~~ of the birth of their baby during the baseline wave of the study between the years of 1998 and 2000. Nearly all (xx%) mothers were interviewed in the hospital, while ~~. F~~Fathers were interviewed in the hospital (76.2%) or by phone (23.8%).[37] Mothers were interviewed between 0 and 112 days after the birth, with 99% of the interviews taking place within seven days of the birth. Fathers were interviewed between 0 and 381 days ~~after~~ of the birth, with 77%

of the interviews taking place within seven days of the birth.[38] Parents were asked by trained interviewers about their health, relationships, employment, finances, and environmental factors.[36]

~~Medical records data~~Birth outcome data were abstracted by trained research staff from birth hospitalization records for mothers and the focal children. These data were available for 3,684 births. Data for the remaining 1214? births was not available because either 1) the hospital did not grant access to this data or there were too few cases to make it financially feasible (n=xx, 38%), 2) the mother refused consent (n=xx, 33%) or 3) the records could not be located in the hospital (n=xx, 29%). All procedures were approved by the Columbia University and the Princeton University Institutional Review Boards (IRBs), and by IRBs at the participating study hospitals.

b.2 Measures

Please see Appendix II-1 and Appendix II-2 for detailed item descriptions, and estimates on the validity and reliability of the measures used in the analyses for this chapter.

Predictors

All exposure variables were measured at the baseline survey, which occurred, in most cases, within a few days after the baby's birth. Four parent-reported summary measures of relationship quality were included in this analysis: 1) *positive couple activities, 2) couple conflict*, 3) *partner support* and 4) *relationship satisfaction*. Table II-1 shows a detailed description of the relationship quality predictor variables. Reports of positive couple activities and conflict referred to experiences over the previous month. Reports of partner support and relationship satisfaction referenced the current moment in time.

Additionally, two other indicators of relationship quality were included. *The baby's father's presence at the birth* was assessed by asking the baby's father whether he was present at the birth (Yes/No). *Relationship duration* was also assessed by asking women how many years and/or months they knew the baby's father before the pregnancy.

Commented [HJ8]: Before the pregnancy began or before the birth?

Table II-1. Relationship Quality Predictor Variables

Relationship Quality Predictor	Measure	Description	Response Scale	Scoring
Positive Couple Activities	Original to Fragile Families	4 items asked whether they had done positive activities with baby's father/mother in the **last month** (e.g. went out to a movie, helped each other solve a problem)	1=Yes 0=No	-Responses summed to form an index -Higher scores correspond to more positive activities (range: 0-4) (α=0.64 w, 0.60 m)
Couple Conflict	Adapted from National Survey of Family Health[39]	6 items assessed frequency of disagreements about specific topics in the **last month** (e.g. money, sex, being faithful)	1= never 2= sometimes 3= often	-Responses summed to form a continuous scale -Higher scores correspond to more disagreement/more conflict (range: 6-18) (α=0.65 w, 0.64 m)
Partner Support	Adapted from Multidimensional Support Scale (MDSS)[40,41] and Susan Loyd's Effects of Violence on Work and Family project.	4 items assessed frequency of supportive and destructive behavior toward respondent by the baby's father/mother (e.g., s/he is fair and willing to compromise, s/he insults or criticizes you or your ideas)	1= often 2= sometimes 3= never	-Responses summed to form a continuous scale -Supportive behaviors were reverse scored. -Higher scores correspond to more partner support (range: 4-12) (α=0.60w, 0.59 m)
Relationship Satisfaction	Original to Fragile Families	6 items ask how life might be different if they were married to the baby's father/mother (for unmarried) or not married to the baby's father/mother (for married) (e.g. financial security, happiness)	4-point scale ranging from 5=much worse to 1=much better	-Responses summed to form a continuous scale -Responses from unmarried respondents were reverse scored. -Higher scores correspond to more partner/relationship satisfaction (range: 6-30) (α=0.72 w,0 .67m)
Baby's Father present at birth	--	Asked baby's father whether he was present at the birth	1=Yes 0=No	Dichotomous
Relationship Duration	--	Asked mothers years and/or months they knew the baby's father before the pregnancy	Months	Continuous (range: 0-432)

Commented [HJ9]: Note that this requires having money – were there other options for things they could have done together?

Commented [HJ10]: I didn't understand this at first – need to explain that w is for women and m is for men and that this Is the Cronbach's alpha. I think there is a different statistic to use when summing dichotomous outcomes in a scale (KR). Make it clear in the table title that you are including scale reliability estimates from THIS data.

Outcomes

The baby's *gestational age at delivery* and *birth weight* were ascertained from the mother's medical record at the birth hospitalization. Gestational age was recorded in weeks and birth weight was recorded in grams.

Covariates

Several confounders were accounted for during model building and are described in detail in Appendix IV1. Demographic confounders included both maternal and paternal age, household income, education and race/ethnicity, and maternal parity, marital status and whether she paid with Medicaid or was otherwise uninsured at the time of delivery.

Commented [HJ11]: If cohabirting?

Other maternal clinical/health confounders included a history of mental health problems before pregnancy, prenatal care, gestational diabetes, pre-eclampsia or eclampsia, obesity during pregnancy, HIV/STI positive during pregnancy and child gender. These measures were abstracted from the mother's medical record.

Maternal use of drugs, alcohol and cigarettes during pregnancy (all yes/no) were also accounted for. These measures were abstracted from the mother's medical record.

Effect Measure Modifier

Marital status (yes/no) was treated as an effect measure modifier with the hypothesis that relationship quality would have a different effect on birth outcomes among married and unmarried couples.

Clustering and Weighting Variables

Due to the sampling procedures described above, descriptive statistics were run using city weights, making the estimates representative of births in the mother's city in the year of the interview.[42] Reliability estimates, correlations and t-tests were not run using any weighting or cluster variables. All regression analyses accounted for city and hospital variables by including these terms in the cluster statement within the SAS procsurvey command. Because mothers' and fathers' responses were included within the same model, a variable identifying the couple (ffchid) was also included in the cluster statement. Because unmarried births were oversampled, all analytical models controlled for marital status (coded 0/1) within the regression equation.

Commented [HJ12]: Not sure I understand this statement - seems like the weight will take care of this – did you include the weights in the regression analyses?

b.3 Statistical Methods

Descriptive Statistics

Descriptive statistics were produced using SAS 9.3 proc freq and proc means commands with city weights applied?. All remaining analyses used SAS 9.3 procsurvey commands and accounted for clustering by couple, and marital status, city and hospital due to the sampling scheme. Procsurvey commands create robust standard errors and therefore the estimates are robust against non-normality.

Correlations of all predictor variables and covariates with each birth outcome were run separately for mothers and fathers using the proc corr SAS command with city weights.

Reliability estimates were calculated for the relationship quality predictor variables separately among mothers and fathers, and were sufficient for research purposes (Table II-2).

Table II-2. Reliability estimates for relationship quality predictor variables among women and men.

	Chronbach's Alpha (unstandardized)	
	Women	**Men**
Positive Couple Activities	0.64	0.60
Couple Disagreements	0.65	0.64
Partner Support Behaviors	0.60	0.59
Relationship Satisfaction	0.72	0.67

Commented [HJ13]: Not sure you need this here and in table 1 – also note that should use a different statistic when the measures are dichotomous - KR

The amount of correlation between the mother's and father's report of the relationship quality predictor variables was also assessed (Table II-3). With the exception of relationship satisfaction, there was a moderate amount of correlation between the predictor variable responses (except a low amount of correlation between reports of relationship satisfaction)[43] among mothers and fathers within couples. Correlation coefficient values corrected for attenuation (by the variable reliability estimates) were also calculated in order to evaluate how highly correlated the scales would be if they were measured without

Commented [HJ14]: You may want to run this on a subsample when you restrict to couples who reported within 30 days of one another or some such number (so that the cases where the woman responded at one point in time and the man a year later, etc.) are not included in this – the relationship may have changed in the interim.

error (Table II-3, columns 3, 5 and 7). These values were calculated for the entire population of interest, while controlling for marital status (columns 2,3), and also for married (columns 4,5) and unmarried couples (columns 6,7) while not controlling for marital status.

The fact that the corrected coefficients in all cases were higher demonstrates that the correlation of mother and father reports could be even greater if the reliability of the variables were greater. Only positive couple activities reached a fairly high level of correlation (.72) indicating that about half of the variation in scores is shared within couples. Nevertheless, some of the variance in scores is not shared, allowing the assessment of the contribution of each partner's reports of the relationship quality predictor variables. Therefore, all regression models that include both mother's and father's reports account for clustering by couple by including the couple identifier within the cluster statement of the SAS procsurvey command.

Table II-3. Correlations and Correlations Corrected for Attenuation between maternal and paternal reports of relationship quality.

	Total Subpopulation		**Married within Subpop**		**Unmarried within Subpop**	
	R	**Corrected R**	**R**	**Corrected R**	**R**	**Corrected R**
Positive Couple Activities	0.43	0.70	0.40	0.64	0.43	0.69
Couple Disagreements	0.35	0.54	0.43	0.67	0.31	0.48
Partner Support Behaviors	0.26	0.44	0.27	0.46	0.25	0.42
Relationship Satisfaction	0.26	0.37	0.14	0.20	0.10	0.15

Regression Model Building

Initially, generalized estimating equations (GEE) were employed to account for the correlated nature of the couple reports and, therefore, clustering by couple. Generalized estimating equations can help tease out the independent effect of each parent on the birth outcomes. GEE produces population average estimates of an effect of the predictor on the outcomes and accounts for clustering of data within couples.[44] GEE analyses, however, are not particularly amenable to handling multiple clustering variables. Due to the sampling structure, the analyses needed to account for multiple levels of clustering, including couple, city, hospital and marital status. Therefore, the analyses were also conducted using linear regression, while accounting for all of the clustering variables. As expected, the effect estimates were the same when employing linear regression and GEE. The confidence limits for estimates created using GEE were only slightly tighter than those of the linear regression estimates and the results were substantively the same. Therefore, I present the results from the linear regression models that account for all clustering variables, which are in effect, more conservative than the GEE models.

Commented [HJ15]: I am confused – GEE can be a form of a linear regression that accounts for clustering – do you mean that you also ran a random effects model for linear regression in addition to a GEE model for linear regression?

To start model building, bivariate associations were produced between each exposure variable (mother and father reports included simultaneously) and each birth outcome separately (birth weight and gestational age) while controlling for couple, city, hospital and marital status

Next, multivariate linear regression models were produced between all exposure variables and each birth outcome separately, including both mothers' and fathers' reports simultaneously within the models

Covariates were then added in steps. Progressively more complicated models added maternal and paternal demographics, maternal clinical health and maternal drug use during pregnancy. To ensure that the time difference between the interviews did not have an unexpected effect on the estimates, model d was also run accounting for the time difference between parental interviews (within 1 week of

each other vs. not). This variable was not significantly associated with either birth outcome in multivariate models, and the effect sizes and significance testing were not substantively changed with the addition of this variable. All models therefore exclude the time difference between parental interviews variable.

Commented [HJ16]: OK but it is more the people that reported months later that I would be worried about – a week or so does not seem so important – perhaps you should use a longer cut off?

Exploration of the Interaction of Mother's and Father's Relationship Quality Reports

Because the results of the regression models were contrary to the original hypothesis that maternal reports of relationship quality would be associated with the birth outcomes, I explored the possibility that maternal and paternal reports had an interactive effect on the birth outcomes. Subsequent models assessed the statistical interaction between maternal and paternal reports of the relationship quality variables conditioned on the same variables included in the full models (model d).

When the P value for the interaction term was less than 0.05, the slopes of the effect of maternal report on the outcome variable at varying levels of the paternal report were explored. First, plots of the effect of the paternal reports of a predictor on the outcome (birth weight or gestational age) controlling for all covariates in model d at 3 levels of the maternal reports of a predictor (low: 1 SD below the mean; medium: the mean; high: 1 SD above the mean) were created. Second, the significance of the slopes of the regression lines (controlling for all covariates in model d) at the three levels of the paternal predictor were assessed according to Aiken and West (1991).[45] Plots and significance testing were created using Daniel Yang's SAS macro "Test and plot a two-way interaction" with continuous variables,[46] which is based on Aiken and West's (1991) model for testing and interpreting interactions.[45]

Effect Measure Modification by Marital Status

To determine whether the association between relationship quality and birth outcomes differed by marital status, I tested for 2-way interactions between marital status and relationship quality by including interaction terms (e.g. marital status*relationship quality variable for mothers and fathers) in multivariate logistic regression models using the Wald test for product term (a p-value of <0.05 indicating significant interaction). When a significant interaction ($P<0.05$) was present between a relationship quality predictor variable and marital status, plots were created of the effect of the continuous predictor on the birth outcome by marital status. The significance of the simple slopes of the regression lines for married and unmarried respondents were determined.

c. Results

c.1 Descriptive Statistics

Demographics

Table II-4 describes the characteristics of the parents included in the sample for this analysis when employing the city weights. The mean birth weight was 3,328.~~37~~ 4 grams +/ SD and the mean gestational age at birth was 38.6~~3~~ weeks +/- SD. The average age of women and men was 27.0 +/- SD~~3~~ and 29.7 +/` SD~~2~~, respectively, and 58.~~47~~5% of parents were married. Women's and men's mean reported household income were just over $43,000.[a] Over half of the participants had a high school degree/equivalent or less education. Most participants were black (30.1~~06~~% women; 31.9~~1~~% men) or Hispanic (32.6~~1~~% women; 37.3~~26~~% men). Most parents (80.1~~4~~%) were interviewed within 1 week of each other.

Behavioral and Clinical Covariates

Cigarette use was somewhat common during pregnancy, with 13.~~29~~3% of women having smoked at some point during their pregnancy. 8.0~~4~~% of women had a pre-pregnancy diagnosis of a mental health problem. The vast majority of women started their prenatal care within the first three months of pregnancy (79.0~~8~~.~~99~~%). Over half of the women received federal or other assistance to pay for the hospital costs associated with their delivery (54.2~~5~~%). Nearly 12% of women had a sexually

Commented [HJ17]: 2 decimal points are unnecessary – suggests too fine a level of accuracy

[a] Data was collected in categorical form from the respondent and then they were given the mean value for that category. About 25% of data was missing. For married and cohabiting couples, the mother's report was used if available, and the father's report was used otherwise. If household income was missing for both parents, the income was imputed using Stata's regression-based impute command. Please see "Introduction to the Fragile Families Public Use Data" (2008)[38] for details..

transmitted infection (STI) or HIV during their pregnancy. ~~All behavioral and clinical covariates were abstracted from the medical record.~~

Relationship Quality Predictors

On average, mothers and fathers reported engaging in three out of four *positive activities* with each other in the previous month. The most common activity reported was helping each other solve a problem (91.~~37~~4% of mothers and 91.~~19~~2% of fathers) and the least common activity was going to a movie (66.1~~0~~% of mothers and 64.0~~5~~% of fathers).

The most common topic of *couple conflict* was money, with 54.6~~0~~% of mothers and 51.5~~47~~% of fathers reporting sometimes or often disagreeing about money in the last month. The second most common topic of conflict was spending time together, with 44.9~~87~~% of mothers and 46.2~~1~~% of fathers reporting sometimes or often disagreeing about spending time together in the last month. The least common topic was conflict about drug or alcohol use, with 9.5~~49~~% of mothers and 10.8~~3~~% of fathers reporting sometimes or often disagreeing about drug or alcohol use in the last month.

Almost 10% (9.9~~88~~%) of mothers and 10.1~~5~~% percent of fathers reported extreme *dissatisfaction with their relationship*. Parents were categorized as being extremely dissatisfied if they had a score of 24 or greater (range 6-30) on this scale. Over 5% (5.3~~4~~%) of mothers and 5.7~~68~~% of fathers reported very low support from their partner by reporting their partner never compromised, never expressed love, never encouraged important things and often criticized ideas.

Table II-5 shows that among fathers, most of the relationship quality predictor variables were significantly correlated with both birth weight and gestational age. Among mothers, however, couple activities, relationship satisfaction and relationship duration were significantly correlated with birth weight and only couple activities was significantly correlated with gestational age. Most of the covariates were significantly correlated with both birth outcomes.

Table II-6 shows that within couples, mother's and father's reports of relationship quality variables did not differ significantly. Mothers reported marginally more relationship satisfaction than their male partners (P=.06).

Table II-7 shows the correlation matrix between the relationship quality variables among mothers and fathers separately. The highest correlation between variables for both men and women was between couple conflict and partner support (r=-0.42, P<.001 mothers; r=-.031, P<.001 fathers). The higher the conflict reported, the lower the parents' report of their partner's support.

Table II-4. Descriptive statistics for subpopulation used in all analyses (singleton births, parents in a relationship, both the father and mother completed the survey and either or both birth weight and/or gestational age data was available from the medical record abstraction).

Commented [HJ18]: If LCL and UCL are supposed to indicate 95% confidence levels – label them as 95% CIs. Again one decimal point. Why are the ns for the mothers and fathers different, shouldn't they be the same?

Commented [HJ19]: Since you found interaction by married/unmarried couples – It would help if you described some of these and other characteristics by marital status.

Commented [HJ20]: Rather than correlations would it make sense to do bivariate linear regressions so that you have crude beta estimates? If you do want to present correlations – did you use Spearmans rather than Pearsons for non-parametric data?

Table II-6. Paired T Tests comparing mother's and father's reports of the relationship quality predictors within couples.

	Mean Mother	Mean Fathers	Mean Diff	t	p
Positive Couple Activities	3.24	3.22	0.02	0.28	0.79
Couple Disagreements	8.07	8.07	0.02	0.20	0.85
Partner Support Behaviors	10.77	10.78	-0.02	-0.15	0.89
Relationship Satisfaction	20.33	19.89	0.45	2.12	0.06

Commented [HJ21]: Probably need to do paired rank sum tests since most likely the data are not normally distributed, and present medians rather than means? Would help to normalize the scales as well since they are all different – so make them all go from 0-1 (instead of some ranging from 0-4, others from 0-24, etc.) That way we can compare the scales across scales.

c.2 Linear Regression with Birth Weight and Gestational Age

Relationship Quality and Birth Weight

Base models run separately for each relationship quality predictor variable, but that included both maternal and paternal reports and controlled for couple, city, hospital and marital status, showed that greater paternal report of conflict in the previous month was significantly associated with lower birth weight (B=-15.63 grams?; 95% CI –26.28,--4.98)(Table II-8). Thus, compared with babies born to fathers who reported no conflict with the baby's mother, babies born to fathers that reported the highest observed level of conflict (reported often disagreeing about all topics) with their partner were, on average, 187.56 grams lighter at birth. Results also showed that babies born to fathers who were present at the birth were on average 125.5~~1~~ grams (95% CIS 59.0, 192,0) heavier than babies born to fathers who were not present at birth ~~(B=125.51; 95% CI 59.03, 191.99)~~. No other maternal or paternal reports of relationship quality predictor variables were significantly associated with birth weight in ~~base~~ crude models. As a point of reference, recent studies have estimated that babies born to light smokers during pregnancy are on average 160 grams lighter at birth than babies born to non-smokers.[47] In this study, the full regression model shows that babies born to smokers were also, on average, 162.6~~0~~ grams lighter than babies born to non-smokers (Table II-10).

Commented [HJ22]: ? how does this match the beta above?

Table II-8. Bivariate linear regression models for birth weight. Models a-f were run separately for each relationship quality predictor variable, with both mother's and father's reports within the same model.

t P<0.1; * P<0.05; ** P<0.01; ***P<0.001

Commented [HJ23]: Help us understand the units of analysis for the scales – is difficult to interpret as each exposure variable is on a differnet scale – would help if they all from 0-1 or were standardized, as a 1 unit increase in each has a different interpretation?

Relationship Quality and Gestational Age

In base models with gestational age as the outcome that included both maternal and paternal reports, the only relationship quality predictor variable that was significantly associated with gestational age at birth was the baby's father's presence at the birth (Table II-9). Babies born to fathers who were not present at the birth were born, on average, 0.61 weeks (4.27 days) earlier than babies whose father was present at the birth (B=-?0.61; 95% CI 0.34, 0.88). As a point of reference, in this study, the full regression model (model d) shows that babies born to smokers were, on average, born nearly 1 day earlier (Table II-11).

Table II-9. Bivariate linear regression models for gestational age. Models a-f were run separately for each relationship quality predictor variable, with both mother's and father's reports within the same model.

c.3 Multivariate Linear Regression with Birth Weight and Gestational Age

Relationship Quality and Birth Weight

Multivariate models that included all of the maternal and paternal reports of the relationship quality predictor variables, and added confounders in a hierarchical fashion showed results similar to the results described above in the simpler base models (Table II-10, models a-d). In the final model (model d), which included all covariates, father's presence at the birth (B= 98.81, 95% CI 21.58, 176.04) was significantly associated with birth weight when controlling for marital status, city, hospital, couple, maternal and paternal demographics, maternal clinical health and maternal substance use during pregnancy (Table II-10, model d). The coefficient for father's presence at birth was reduced by 32.19 grams once all variables were added to the model, but remained statistically significant. This suggests that neither the confounders nor the potential mediators (e.g. smoking) account for the association of the father's presence at birth with birth weight.

Father's reports of conflict remained marginally significantly associated with birth weight (B=-11.54; 95% CI -23.54, 0.47) in the final model accounting for maternal and paternal demographics, maternal clinical/health and maternal substance use during pregnancy. With the addition of maternal substance use during pregnancy (models c to d), which could also be considered mediators as substance use may result from high levels of stress, the coefficient became marginally significant, but was reduced by only 0.91 grams.

Relationship Quality and Gestational Age

In multivariate models, father's reports of conflict (B= -0.05; 95% CI 0.11,-0.002) and father's presence at the birth (B= 0.51; 95% CI 0.19, 0.83) were significantly associated with gestational age at birth when controlling for all covariates (Table II-11, model d). The coefficient for father's report of conflict remained virtually unchanged with the addition of control variables (from -0.06 in model a to -

0.05 in model d), suggesting that neither the confounders nor the potential mediators account for the association between father's report of conflict and gestational age at birth. The coefficient for the father's presence at the birth was reduced the most with the addition of maternal and paternal demographic variables (from 0.63 in model a to 0.56 in model b) and only slightly reduced with the addition of maternal clinical health indicators and pregnancy substance use (0.51 in model d). For this variable, the confounders and potential mediators accounted for about 19% of the effect of father's presence at the birth on gestational age.

Commented [HJ24]: I don't think you can really say this.

d.4 Interaction of Parental Reports

There were significant interactions between maternal and paternal reports of couple conflict in the association with birth weight (B=-27.99, t=-2.48, SE=P=.01). No other interaction terms were significant at the P<0.05 level.

Commented [HJ25]: Is this the beta for the interaction term? IF so not really interpretable.

As shown in Figure II-2, I further explored the association between paternal reports of couple conflict with birth weight at three levels of maternal report of couple conflict controlling for all variables in the full model (model d): low: 1 SD below the mean; medium: the mean; high: 1 SD above the mean using Aiken and West (1991) as a guide.[45]

Commented [HJ26]: This is a bit hard to interpret as well – what do you think the figure is telling us?

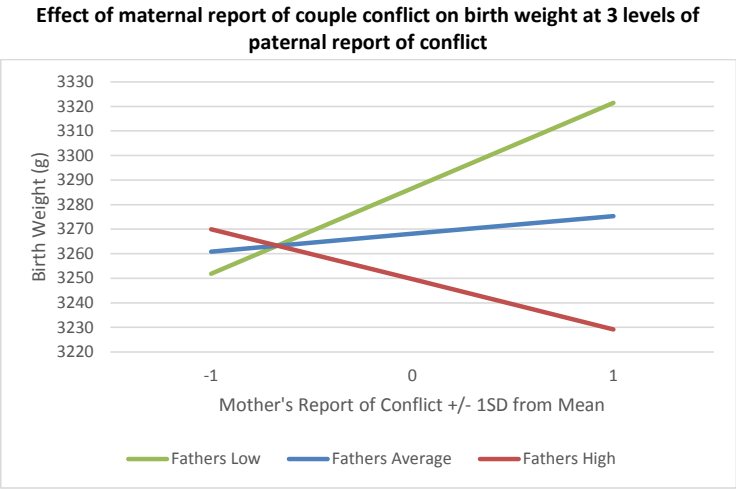

Figure II-2. Effect of maternal report of couple conflict on birth weight at three levels of paternal report of couple conflict: low: 1 SD below the mean; medium: the mean; high: 1 SD above the mean.

d.5 Effect Measure Modification by Marital Status

There was a significant interaction between paternal report of couple conflict and marital status in the association with birth weight (B=27.27, 95% CI 1.08, 53.46, P=.04). When looking at simple slopes, among unmarried fathers, those who reported greater couple conflict had babies with lower birth weight on average (B=-14.92, 95% CI -28.24, -1.61, P=.03). The association between ~~relationship satisfaction~~couple conflict? and birth weight was not significant among married fathers (Figure II-3). To explore whether the effect of fathers report of conflict on birth weight among unmarried men was driven by unmarried men reporting more conflict on average, I added the interaction term between marital status and father's report of conflict into the interaction model with maternal and paternal report of couple conflict (section d.4). The interaction between maternal and paternal report of couple conflict remained significant, the effect size did not change substantially and the interaction between paternal report of conflict and marital status was not significant. This result suggests that the effect of paternal report of conflict on birth weight is not driven by unmarried men reporting higher average conflict in general. The interaction between paternal report of conflict and marital status was not significant.

Commented [HJ27]: This section is confusing – not sure what you are testing – it seems like for both outcomes two exposures seemed important paternal reports of couple conflict and fathers presence at birth – so you would want to see whether marital status interacts with both exposures (conflict and presence at birth) for both outcomes (birth weight and gestational age). This would make it easier for the reader to follow (I think).

Commented [HJ28]: This last sentence is confusing as it seems to contradict the first sentence (?). I am having a hard time following what you did here.

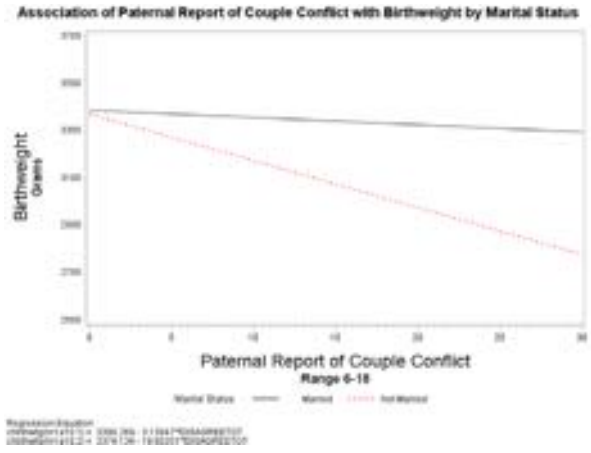

Figure II-3. Effect measure modification of the association between paternal report of couple conflict and birth weight by marital status.

There was a significant interaction between relationship duration and marital status in the association with birth weight (B=-1.07, 95% CI -2.10, -0.04, P=.04). When looking at simple slopes, among unmarried couples, those who reported greater relationship duration had babies with greater birth weight on average (B=0.75, 95% CI .08, 1.42, P=0.03). The association between relationship duration and birth weight was not significant among married couples (Figure II-4).

Commented [HJ29]: Not clear why you did not see whether the same interaction with marital status and paternal conflict was also seen with gestational age?

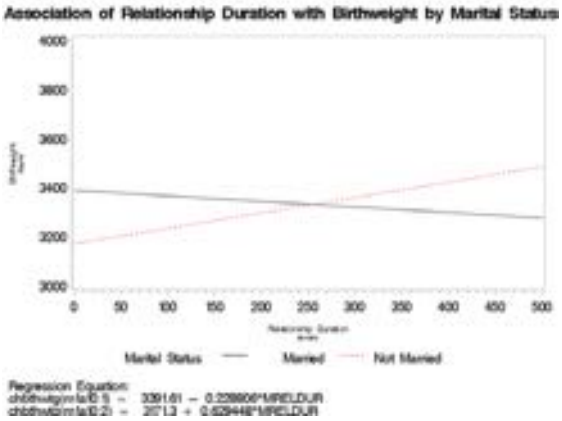

Figure II-4. Effect measure modification of the association relationship duration and birth weight by marital status.

Marital status did not interact significantly with any other relationship quality predictor variables when predicting birth weight.

Marital status did not interact significantly with any relationship quality variables when predicting gestational age at birth.

d. Comment

Among this national sample of married and unmarried parents in a relationship, the father's report of conflict with his partner over the previous month and the father's presence at birth were both significantly associated with having a baby with a lower birth weight and an earlier gestational age at birth after controlling for maternal and paternal demographic factors, maternal pregnancy clinical health and maternal substance use during pregnancy. The effect sizes of findings were substantial. Babies born to fathers who fell into the highest quartile of conflict were 69.68 grams lighter than babies born to fathers who fell into the lowest quartile of conflict after controlling for all covariates. Additionally, babies born to fathers who were not present at the birth were nearly 99 grams lighter after controlling for all covariates. Estimates show that babies born to *light* smokers during pregnancy are on average 160 grams lighter at birth than babies born to non-smokers. Therefore, these effect sizes are not neglegible.[47]

Commented [HJ30]: I think it would help the reader if you would summarize all of the findings in a summary paragraph and then discuss each separately – hard to remember what you found since there were many exposures/predictors. And also hard to remember exactly what you found with effect measure modification by marital status.

Commented [HJ31]: But the conflict variable really only had an effect in unmarried couples right? Based on the interaction in that model – did you test for interaction in the other model?

Conflict in a relationship and the association with birth outcomes

Conflict in a romantic relationship can cause serious stress among both members of an expectant couple and the evidence from this study supports the hypothesis that this conflict can have a deleterious effect on two important birth outcomes: birth weight and gestational age. A plethora of studies have shown that women's experiences of stress during pregnancy are associated with PTB[13,16–19] and LBW.[16,17,20,21] The findings from the current research show that men's experiences of conflict within a relationship have a significant association with negative birth outcomes, suggesting that men's experiences and feelings when they are expecting a baby may have a unique contribution to poor birth outcomes.

Recent evidence has demonstrated that elevated levels of stress hormones, such as cortisol, among pregnant women are associated with lower birth weight[48] and lower gestational age at birth.[49] A

recent study by Feinberg et al. (2013), however, showed that salivary cortisol levels were elevated among both partners in an expecting couple in response to conflict within their relationship. Emotional contagion research has shown that feelings and emotions among members of a romantic couple tend to spill-over from one member of the couple to the other.[50] Thus, men's and women's stress reactions may converge and ultimately have an interactive effect on birth outcomes. Consistent with this research, the results of the interaction between maternal and paternal reports of conflict suggest that the average birth weight was the lowest when both parents reported high levels of conflict with their partner. Further, the results suggest that the mother's report of conflict is protective--when mothers perceive low levels of conflict, the father's report of conflict does not have an effect on birth weight; however, ~~at~~ when mothers report high levels of conflict, the greater the father's the report of conflict the worse it is for the baby.

Commented [HJ32]: Not sure I see where you are getting this from?

Differences in the association of relationship quality with birth outcomes by marital status

Many studies have demonstrated that babies born to married parents, on average, have greater birth weight and a longer gestation compared to babies born to unmarried parents.[51] We know little, however, beyond associated socioeconomic status, about what about being unmarried or married affects birth outcomes. The results from this study show that paternal reports of conflict were only significantly predictive of lower birth weight among *unmarried* fathers. This finding is consistent with previous qualitative research showing that married and unmarried couples perceive tensions in their relationship differently. Waller (2008) found that unmarried couples felt tensions were a greater risk to the stability of their relationship.[35] Conflict in a relationship is a fact of life; however, the results of this study may suggest that couple conflict may cause more stress among unmarried couples than married couples, and therefore have a more negative effect on birth outcomes among unmarried couples.

In addition, relationship duration was only predictive of greater birth weight among *unmarried* couples in this study. It is possible that being married is a useful indicator of a committed relationship with more resources to support a healthy pregnancy; however the story is more nuanced among unmarried couples where the duration of the relationship may matter more. This finding may suggest that among unmarried couples, those who have been in a relationship longer may have developed healthier relationships (e.g. better ways to deal with conflict) that can support a healthier pregnancy than unmarried couples who have known each other for a shorter period of time.

Commented [HJ33]: This is why it would help to see some of the characterisitics – what was the average duration of marriage versus partnership status before marriage – were the distributions similar or was there more variability (especially in terms of shorter relationships in the unmarried group)?

The association of the baby's father's presence at birth with birth outcomes

In the current study, the baby's father's presence at the birth was significantly associated with both the baby's birth weight and gestational age at birth among married and unmarried couples alike. In fact, the magnitude~~size~~ of the effect on birth weight is similar to ~~right up there with~~ the effect of light smoking during pregnancy on birth weight.[47] Whether the baby's father was present at the birth may be a useful way to discern between pregnancies that are more at risk for negative birth outcomes (and potentially poor child health outcomes later). The baby's father's presence at the birth may be a marker of the father's involvement and support, both material and emotional, during the pregnancy. As theorized by Alio et al (2010), support from the baby's father during pregnancy may decrease maternal stress and encourage healthy behaviors, ultimately leading to better birth outcomes.[27]

A study by Teitler (2001) among unmarried couples only within the Fragile Families study, however, did not find that the father's presence at the hospital for the baby's birth or visited around that time had an effect on the risk for low birth weight.[29] Teitler (2001) did find that the father's presence at the birth had a positive effect on maternal health behaviors, however.[29] Thus, this study is unique in that it found a significant association between the baby's father's presence at the birth and both birth weight and gestational age among the Fragile Families population after controlling for

Commented [HJ34]: Did you test for interaction here as well?

maternal and paternal demographics, and maternal clinical health and substance use during pregnancy. The differences between Teitler's (2001) findings and the findings in this study are likely due to the fact that 1) Teitler's analysis only included unmarried couples, while this analysis uses all couples in a relationship; 2) Teitler used a dichotomous measure of low birth weight, while this study looked at the continuous forms of birth weight and gestational age abstracted from the medical record and 3) Teitler used the mother's report of whether the father was present at the birth, whereas this study uses the father's report of his own actions (though Teitler reports that the results were substantively the same using father report).

Limitations

While this study has many strengths, it is not without limitation. This secondary data analysis is limited by the study design and the measures collected. The timing of assessments are of some concern. Parents' report of their relationship quality was assessed shortly after the birth of their baby, raising concern over the issue of reverse causality. It is possible, though unlikely, that having a child born with a low birth weight or too early could cause parents to reflect more negatively about their relationship with their partner due to the stress that they are under. In addition, the fathers and mothers were not always interviewed on the same day, thus their perspectives on their relationship may differ due to the elapsed time and events that may have occurred within this time, rather than true differences in how they perceived their relationship quality. A sensitivity analysis was conducted comparing the results among couples that were interviewed within one week of each other versus the more than one week, and the results among the two groups were substantively the same.

Commented [HJ35]: This is could although – above you said you adjusted for it in the model which is different from running the model with the sub sample that reported within a week and again it Is the long time dirsuptions that would concern me more – would help if you would describe the time different – average, range, etc, in a bit more detail in the descriptive section so that we know how concerned we should be about it.

As with all observational studiest, there could be ~~Another concern is over whether there are\~~ important omitted ~~variables~~ confounders that could explain the relationship between relationship quality factors and the birth outcomes. Unfortunately, due the limitations of the study design and

measures collected, we cannot tease out unmeasured confounding of the association between relationship quality and birth outcomes by some other parental characteristic (e.g. personality, depression) that would affect both the exposure and outcome.

Strengths

Despite these limitations, this study provides an expanded and more comprehensive assessment of relationship quality and its association with birth outcomes compared to previous studies which have been limited to assessing paternal social support, markers of paternal involvement (e.g. father's name on birth certificate, paternal financial contributions) and intimate partner violence.[27–29,52] This study also included direct report of relationship quality from the fathers, while most studies use reports only from mothers, and included both maternal and paternal reports within the same statistical model while accounting for clustering by couple. This study was thereby able to show that men's experiences and feelings when they are expecting a baby may have a unique contribution to poor birth outcomes—something that no other study has ever done.

Commented [HJ36]: Which was noticeably lacking here – were there no measures of IPV?

Implications for Future Research and practice

This study suggests that dimensions of relationship quality, and most saliently couple conflict and the baby's father's absence at the birth, are associated with birth outcomes at a level that is nearly commensurate with the effect of light smoking on birth outcomes. Further, in this study, men's report of his experiences of conflict had an effect on birth outcomes while the mother's reports acted only in concert with their partner's report. Our nation has spent the last several decades focusing on changing maternal behaviors (e.g. smoking during pregnancy and attending prenatal care) to improve population rates of low birth weight and preterm birth with little luck. Programs and policies that not only address

Commented [HJ37]: Not sure that I understand this statement.

the importance of healthy romantic relationships, but that also include both members of an expectant couple, may help support healthier pregnancies and improve the rates of negative birth outcomes.

Overall excellent work, Anna and very interesting. It would help if you would clarify the EMM section in a bit more detail and in the discussion, I would like to see more about why the father being at the delivery is important – seems like a measure of social support of a kind. Also would help if you describe/interpret the correlations between the measures – so couples with high conflict tended to not have the father present at birth, etc., and justify a bit how these are all measuring different things, so that it makes sense to include them all in the same model (versus if they are highly collinear).

Great work overall – hope these comments are helpful!

Appendix II-1. Variable descriptions and details.

Construct	Measure and Reference	Description	Response Scale	Time Points Assessed	Time Frame Referenced	Summary Measure
Exposures: Relationship Quality						
Positive Couple Activities	Original to Fragile Families	4 items asked whether they had done positive activities with baby's father/mother (e.g. went out to a movie, helped each other solve a problem)	1=Yes 0=No	Baseline	Last month	-Responses summed to form an index -Higher scores correspond to more positive activities (range: 0-4) (α=0.64 w, 0.60 m)
Couple Conflict	Adapted from National Survey of Family Health[39]	6 items assessed frequency of disagreements about specific topics (e.g. money, sex, being faithful)	1= never 2= sometimes 3= often	Baseline	Last month	-Responses summed to form a continuous scale -Higher scores correspond to more disagreement/more conflict (range: 6-18) (α=0.65 w, 0.64 m)
Partner Support	Adapted from Multidimensional Support Scale (MDSS)[40,41] and Susan Loyd's Effects of Violence on Work and Family project.	4 items assessed frequency of supportive and destructive behavior toward respondent by the baby's father/mother (e.g., s/he is fair and willing to compromise, s/he insults or criticizes you or your ideas)	1= often 2= sometimes 3= never	Baseline	Current	-Responses summed to form a continuous scale -Supportive behaviors were reverse scored. -Higher scores correspond to more partner support (range: 4-12) (α=0.60w, 0.59 m)
Relationship Satisfaction	Original to Fragile Families	6 items ask how life might be different if they were married to the baby's father/mother (for unmarried) or not married to the baby's father/mother (for married) (e.g. financial security, happiness)	4-point scale ranging from 5=much worse to 1=much better	Baseline	Current	-Responses summed to form a continuous scale -Responses from unmarried respondents were reverse scored. -Higher scores correspond to more partner/relationship satisfaction (range: 6-30) (α=0.72 w,0 .67m)
BF present at birth	--	Asked baby's father whether he was present at the birth	1=Yes 0=No	Baseline	--	Dichotomous

Relationship Duration	--	Asked mothers years and/or months they knew the baby's father before the pregnancy	Months	Baseline	--	Continuous (range: 0-432)
Birth Outcomes						
Birth Weight	Weight at birth	--	Grams	Medical Records	--	Continuous (range : 470-5,585)
Gestational Age at Birth	Weeks pregnant at birth	--	Weeks	Medical Records	--	Continuous (range: 23-46)
Effect Measure Modifier						
Marital Status	--	Asked whether currently married to father of the baby	1=Yes 2=No	Baseline	Current	Dichotomous
Confounders						
Age	--	Summary variable created by FF from birth date.	--	Baseline	Current	Continuous (range:15-43 women 15-53 men)
Household Income	--	Asks: "Thinking about your income and the income of everyone else who lives with you, what was your total household income before taxes in the past 12 months?"	1= < $5,000 2= $5,000 to $9,999 3= $10,000 to $14,999 4= $15,000 to $19,999 5= $20,000 to $24,999 6= $25,000 to $34,999 7= $35,000 to $49,999 8= $50,000 to $74,999 9= > $75,000	Baseline	Current	Categorical
Education	--	Asks the highest grade or year of regular school that they have completed.	1= < high school 2= high school/equiv 3= some coll, tech 4= coll or grad	Baseline	Current	Categorical
Race/Ethnicity	--	Asks which category best describes their race and ethnicity.	1= White 2= Black 3= Hispanic 4= Other	Baseline	Current	Categorical
MATERNAL ONLY						
Parity	--	From medical record *before* the index child was born.	--	Baseline & Medical Records	Current	Continuous (range: 0-12)
Paid for birth with	--	Payment for delivery	1=Yes	Medical Records	--	Dichotomous

Medicaid or was uninsured		indicated as Medicaid, partial Medicaid, Uninsured or other government program	0=No			
Smoking During Pregnancy	--	Mother smoked cigarettes during pregnancy, from all possible sources in the medical record	1=Yes 0=No	Medical Records	During Pregnancy	Dichotomous
Drug Use During Pregnancy	--	Mother used drugs during pregnancy, from all possible sources in the medical record	1=Yes 0=No	Medical Records	During Pregnancy	Dichotomous
Alcohol Use During Pregnancy	--	Mother used alcohol during pregnancy, from all possible sources in the medical record	1=Yes 0=No	Medical Records	During Pregnancy	Dichotomous
Trimester Prenatal Care Initiated	--	Variable constructed by FF that indicates the trimester prenatal care was initiated	1= First Trimester 2=Second Trimester 3=Third Trimester	Medical Records	During Pregnancy	Categorical
Mental Illness Pre-Pregnancy	--	Mother had pre-pregnancy diagnosis of mental illness, from all possible sources in medical record	1=Yes 0=No	Medical Records	Pre-Pregnancy Diagnosis	Dichotomous
Pre-Existing Diabetes	--	Mother had pre-pregnancy diagnosis of diabetes, from all possible sources in medical record	1=Yes 0=No	Medical Records	Pre-Pregnancy Diagnosis	Dichotomous
Pre-Existing Hypertension	--	Mother had pre-pregnancy diagnosis of hypertension, from all possible sources in medical record	1=Yes 0=No	Medical Records	Pre-Pregnancy Diagnosis	Dichotomous
Time between Mother and Father Interviews	--	Days between parental interviews	Days	Baseline	After Delivery	Continuous (range: 0-32)

Appendix II-2. Measure details, validity and reliability

The following summary variables were created using items from the Fragile Families and Child Well Being Study Baseline Survey of Parents.[53]

Positive Couple Activities

The following 4 items comprising the positive couple activities measure were developed for the Fragile Families study. The 4 questions listed below asked parents whether they had done positive activities with the baby's father/mother in the last month or the last month they were together (1=Yes, 0=No). A total positive couple behavior score was created by summing the responses (α =0.64 mothers and 0.60 fathers; range 0-4).

I'm going to read you some things that couples often do together. Tell me which ones you and [BABY'S FATHER/MOTHER] have done together in the past month

1. *visited with friends*
2. *went out to a movie, sporting event, or some other entertainment*
3. *ate out in a restaurant*
4. *helped each other solve a problem*

No specific validity information is provided by the principal investigators; however, this measure has been successfully employed as an indicator of relationship quality using Fragile Families data. A study among adolescents and young adults in the FF study used the four items assessing joint participation in activities together (KR20=.67 for fathers; KR20=.74 for mothers). More positive couple activities reported by the mother predicted more father involvement 3 years later.[37]

Couple Conflict

This measure was loosely adapted from the National Survey of Family Health.[39] Questions asked parents how often they had disagreements about six topics listed below. Parents responded on a three point scale ranging from 3=often, 2=sometimes, 1=never. Responses were summed to form a continuous score, with higher scores indicating less conflict and more agreement in the relationship (Chronbach's α= 0.65 mothers and 0.64 fathers; range 6-18).

The following is a list of subjects on which couples often have disagreements. How often, if at all, in the last month have you and [BABY'S FATHER/MOTHER] had disagreements about each of the following:

1. *money*
2. *spending time together*
3. *sex*
4. *the pregnancy*
5. *drinking or drug use*
6. *being faithful*

Results of formal tests of the measure's validity have not been reported, however, several analyses of Fragile Families data have used this measure as an indicator of relationship quality. A study assessing relationship conflict and union formation used the 6 items about relationship conflict. The frequency of conflict was represented by the mean of parents' reports about whether they "never" (1), "sometimes" (2), or "often" (3) had conflict over the six items in the last month. Reports of conflict had inconsistent effects. Only father's reports of conflict significantly deterred cohabitation.[54] No chronbach's alpha was reported.

Another study found that couple conflict measured using maternal report of these items (chronbach's α =0.65) predicted poor maternal prenatal health behaviors.[55] A study among adolescents and young adults in the FF study used conflict items (α =0.64 mothers and 0.62 fathers) to predict father involvement. Disagreements reported by both mothers and fathers were not significantly associated with father involvement 3 years later.[37]

Partner Support

This measure was loosely adapted from the Winefield et al. Multi-Dimensional Support Scale (MDSS). Five questions asked parents how often the mother or father of their baby displayed supportive or destructive behavior toward the respondent. Parents responded on a three point scale ranging from 1=often, 2=sometimes, 3=never about the items listed below. Support (positive) behaviors were reverse-scored when creating a total score, which summed the responses. Higher scores indicate more supportive and less destructive behaviors toward the respondent. Factor analysis using maximum likelihood indicated that the "s/he hits or slaps you when angry" item did not load above 0.32 (standard threshold)[56] on to the partner support factor. Therefore, this item was excluded and a four item variable using the other items was created (α =0.60 mothers and 0.59 fathers; range 4-12).

Thinking about your relationship with [BABY'S FATHER/MOTHER], how often would you say that:

1. *s/he is fair and willing to compromise when you have a disagreement*
2. *s/he hits or slaps you when angry (*not include in summary variable)
3. *s/he expresses affection or love for you*
4. *s/he insults or criticizes you or your ideas*
5. *s/he encourages or helps you do things that are important to you*

Alpha coefficients are generally high for the MDSS (>.75) and the subscale scores correlate well with affect measures (e.g. depressive affect, self-esteem, psychological disturbance).[41]

Several analyses of Fragile Families data have used this measure, in different forms, as an indicator of relationship quality. A 9-item version was used 1 year postpartum among Fragile Families Fathers. These 9 items included the 5 items assessed at baseline. The author dichotomized the outcome (sometime and often vs. never). Chronbach's α was 0.90 for married fathers and 0.93 for unmarried fathers. Relationship quality predicted perceptions of co-parental support for married fathers but not unmarried fathers.[57]

A 6 item version (which included the 5 items included in this analysis) was used 1 year postpartum among Fragile Families mothers and fathers. Authors averaged the scores for mothers and fathers

(chronbach's α =0.76). Better relationship quality predicted greater parental engagement in infant and toddler years, with married and cohabiting couples similar in the association.[58]

A 4 item version ("insults or criticizes you or your ideas,""expresses affection or love for you," "is fair and willing to compromise," and "encourages and helps you to do things.") using baseline assessments from all mothers significantly predicted (chronbach's α =0.66) breastfeeding rates only among African Americans.[59]

Relationship Satisfaction

The items for this measure were developed specifically for the Fragile Families Study. The 6 items ask how life might be different if they were married to the baby's father/mother (for unmarried couples) or *not* married to the baby's father/mother for the married couples). Couples reported responses to the following items on a scale from 1=much better to 5=much worse. The responses for unmarried respondents were reverse scored with the theory that if they rated that the items would be worse with marriage, they were demonstrating a lack of satisfaction with their partner and/or relationship. Coding for responses for married respondents were maintained because if they rated that the items would be much worse if they were not married to the baby's father/mother, it shows they are more satisfied with their partner and/or relationship. A total relationship status satisfaction score was created by summing the responses. Higher scores indicate more satisfaction with their partner and/or relationship (α =0.72 mothers and 0.67 fathers; range 6-30).

If you were/were not married, how would life be different in terms of:

1. *financial security*
2. *overall happiness,*
3. *freedom to do what you want*
4. *control over money*
5. *sex life*
6. *relations with parents*

No Fragile Families analyses to my knowledge have used these questions as a summary measure representing relationship quality. Therefore, this dissertation is a novel use of these questions as a representation of relationship quality.

Chapter III. Parental Stress during Pregnancy and Birth Outcomes among Children in the Parenting and Relationship Transition and Risk Study

a. Introduction

Preterm birth (PTB; <37 weeks gestation) and low birth weight (LBW; <2,500 grams) are leading causes of infant mortality in the United States (U.S.)[1] and infants born pre-term and/or with a LBW are at increased risk for negative health and developmental issues as they grow.[2,3] Of all infants born in the U.S., 11.3% are born pre-term and 8.0% are born with a low birth weight.[4] Among teens aged 15-19, the rates of PTB and LBW are even higher at 13.960% and 9.31% respectively.[4] Among babies born to 15 year olds, 17.35% are born preterm and 10.23% have a low birth weight.[4] The higher rates of these adverse birth outcomes among teens has been attributed to maternal risk factors associated with teenage pregnancy, such as low socioeconomic status, minority status, and inadequate prenatal care.[5,6] A study by Chen et. Al. (2007),A cohort? study of xx pregnant women comparing teens to adults?, however, found that teen pregnancy increases the risk for adverse birth outcomes even after adjusting for these factors independent of these confounders,[7] suggesting that other factors are also at play.

Stress as a predictor of birth outcomes

Epidemiological evidence shows that maternal stress during pregnancy is consistently predictive of negative birth outcomes, including PTB[8–12] and LBW.[8,10,13,14] In fact, the American Congress of Obstetricians and Gynecologists recommends screening for psychosocial stress as part of prenatal care, citing that it may play a role in PTB and LBW.[15] Adolescents and young adults experience stressors that emanate from various life domains, including close relationships and personal hardships, but for adolescents and young adults who are racial and/or ethnic minorities and from a low socioeconomic status (SES), daily stressors often extend beyond these typical developmental challenges. This population is disproportionately affected by other chronic stressors, such as neighborhood problems, racism and discrimination. Given thisThus, stress may have a substantial effect on birth outcomes among this more vulnerable populationlow SES youth of color.

Commented [JD1]: More specific? "problems" is a bit vague given the large neighborhood literature.

Commented [HJ2]: References?

Conceptually, stress is an interactive process in which environmental demands exceed one's adaptive capacity, resulting in three types of responses that can lead to poor health outcomes and, therefore, serve as mediators between experiences of stress and adverse birth outcomes: 1) behavioral, 2) cognitive/psychological and 3) physiological responses.[16–18] ~~It is through these three inter-related stress-response processes, detailed below, that experiences~~ Experiences of stress are ~~thought~~ hypothesized to affect birth outcomes through these three inter-related stress-response processes, as detailed below.[19]

First, negative health behaviors, such as smoking or substance use, can serve as coping mechanisms for stress.[17,20] Studies show that stress consistently predicts negative health behaviors (e.g. smoking, substance use, poor dietary habits, physical inactivity) among pregnant women,[18,21] which are also consistently related to adverse birth outcomes. For example, smoking and substance use are well-documented ~~predictors~~ causes of PTB,[22] and inadequate nutrition and smoking are known risk factors for LBW.[18,23]

Second, negative appraisals or perceptions of stress are thought to cause cognitive and psychological responses, which subsequently directly affect both behavioral and physiologic responses, and risk for physical and mental disease.[16] These psychological responses include depressive symptoms, which have been independently linked with negative birth outcomes.[24]

Third, two physiologic pathways through which stress and the cognitive and psychological responses may affect birth outcomes include the neuroendocrine system—specifically the hypothalamic-pituitary-axis (HPA), which regulates the physiological response—and the immune/inflammation system. Under conditions of chronic psychological stress, the HPA axis can become dysregulated, leading to chronically elevated levels of glucocorticoids in the system,[9] which could signal a series of endocrine events leading to PTB.[9] Stress may cause preterm birth through the immune/inflammation pathway by increasing maternal susceptibility to infection,[8] causing the release of

catecholamines[8] or causing an inflammatory response that triggers contractions, cervical ripening and membrane rupture.[25]

Dunkel Schetter and Lobel[18] offer the most comprehensive framework depicting the~~se~~ pathways through which maternal stress may influence PTB and LBW (Figure III-1). The conceptual model describes how both chronic (persistent or recurrent difficulties over the long term) and acute (discrete threats that are shorter term) stressors can influence birth weight and gestational age at delivery. Dunkel Schetter and Lobel's framework synthesizes findings from a large literature examining individual stress components and birth outcomes. Previous studies, however, have been inconsistent in terms of how stress is conceptualized, if a conceptual model is attended to at all, and none assess all components of this model, including stress exposures, appraisal, responses and birth outcomes.

Commented [HJ3]: References?

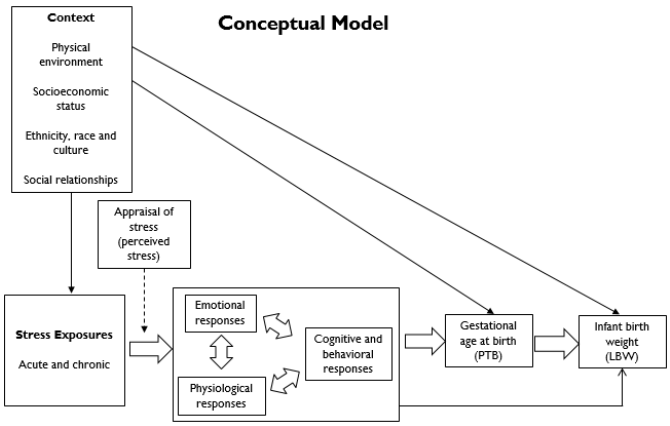

Figure III-1. Conceptual model of the pathway between maternal experiences of stress and adverse birth outcomes as proposed by Dunkel Schetter and Lobel.[18]

Sources of stress

The stressors that expectant parents experience may come from multiple sources, including individual experiences (e.g. job loss), interpersonal exposures (e.g. conflict in a steady relationship), neighborhood conditions (e.g. crime in neighborhood), ~~to~~ and societal context (e.g. racism). These stressors are more common among low income populations and racial and ethnic minorities due to social and economic structures and influences.[26] These stressors ~~are all thought to~~could influence birth outcomes through the behavioral, psychological and physiological pathways described above, and a large body of literature has examined how maternal experiences in each of these domains is associated with negative birth outcomes. For example, checklist inventories of acute major life events mothers experienced during pregnancy have been associated consistently with lower infant birth weight and gestational age at birth.[14,18] Maternal perception of neighborhood problems during pregnancy have been significantly associated with lower infant birth weight,[27] with the hypothesis that living in a disadvantaged neighborhood causes stress by increasing the likelihood of experiencing stressful life events and exposing individuals to neighborhood disorder.[28] Discrimination and racism are also thought to cause chronic stress; however, the findings on the effects of maternal experiences of discrimination on birth outcomes have been mixed. Some studies exploring whether maternal experiences of discrimination during pregnancy are associated with LBW and PTB have found a significant association (e.g. Dominguez et al.,[29] Collins et al.[30]), while others have not (e.g. Lu and Chen,[31] Shiono et al.[32]). Most studies have assessed the influence of these different sources of stressors on birth outcomes individually, despite acknowledgement that birth outcomes are the result of conjoint effects of multiple factors.[18]

Commented [HJ4]: All of them?

Stress among expectant adolescents and young adults

While stress ~~is a fact of life that~~ cuts across all populations, stress may have a ~~more substantial~~ larger deleterious effect on ~~certain vulnerable populations. A~~expectant adolescents and young adults ~~adults are one such population who may be especially susceptible to the ill effects of stress~~ for several reasons. First, adolescents and young adults are ~~still~~ developing and may lack effective coping skills and resources.[33] Second, pregnancy itself can be a stressor for any expectant parent,[34] but the transition to parenthood may be exceptionally stressful for adolescents because they are concurrently confronting the challenges of parenthood and adolescent development.[35] Pregnancy can also give rise to or exacerbate other stressors that may be more common among adolescents and young adults compared to older expectant parents (e.g. financial concerns for supporting a new baby, relationship problems).[36] Third, during adolescence and young adulthood, social relationships outside of the family, including romantic relationships, become increasingly important.[37] An adolescent's romantic partner plays an important role in the attachment, support, and caregiving behavioral systems.[38] Most expectant adolescents and young adults are involved with the baby's father during pregnancy;[39,40] however they are still learning to interact with their partner and developing their relationship skills[38] and therefore negotiating this relationship may be a significant source of stress for this population compared to older adults.

Paternal Influence on birth outcomes

A large body of literature has documented that women's experiences of stress during pregnancy are associated with negative birth outcomes;[8–13] however, research has also demonstrated that the perceptions of stress and coping strategies are affected by social relationships.[41] The relationship with the baby's father is often an important social relationship in an expectant woman's life, regardless of ~~whether she is married to him or not~~marital status. Over 80% of unmarried pregnant women are in a

relationship with the baby's father during pregnancy.[42] Thus, a woman's male partner likely has a substantial influence on the expectant mother during this time.

Despite the importance of male partners during pregnancy, very little research has explored paternal influences on birth outcomes.[43] Research examining the impact of stress on birth outcomes that includes paternal factors has been limited to maternal reports of paternal involvement and support, and these measures are often crude (e.g. the extent to which there is a father's name on the birth certificate).[44,45] Researchers and clinicians have almost entirely focused on how women's experiences are associated with birth outcomes; however, men's experiences of stress during his partner's pregnancy may also influence birth outcomes through his effects on maternal psychosocial factors.[46]

In fact, substantial evidence supports the theory that among couples, stress experienced by one member can ~~cross-over and~~ affect the well-being of the other member.[47] For example, a woman's partner's stress with his friends may ~~cross-over and~~ impact her own depression. [47] Much of this research has focused on the cross-over of one's work stress to the other's well-being[47] and relationship satisfaction (e.g. Neff[48]); however no studies have documented this process among expectant couples, and none have assessed the impact of paternal stress during pregnancy on birth outcomes via effects on maternal well-being.

Current study

The current study aims to, first, investigate the association between maternal and paternal stress during pregnancy and the gestational age at birth and birth weight of their baby among adolescent and young adults from low SES?. Second, this study aims to explore whether the association of maternal and paternal experiences of stress with birth outcomes is mediated by maternal depressive symptoms.

b. Methods

b.1 Data Source

Overview and Sampling Procedures

Data for this analysis come from baseline interviews of 296 expectant young couples who participated in the Parenting and Relationship Transition and Risk Study (PARTNRS) between 2007 and 2011, and birth hospitalization medical records. Women were recruited from obstetrics and gynecology clinics and an ultrasound clinic in four university-affiliated hospitals in lower Connecticut. An initial screening included only women who reported they were in a romantic relationship with the baby's father.

If the baby's father was not present at the time of screening, research staff asked for permission to contact him to explain the study. If the expectant woman was willing, research staff provided informational materials for the baby's father and asked the baby's mother to talk to him about the study. Research staff contacted the baby's father to answer any questions and, if he was interested, scheduled an appointment for the couple's baseline interview.

Participants

Inclusion criteria to participate in the baseline interview for both men and women were: (a) pregnant or partner was pregnant after 24 weeks gestation; (b) women were age 14-21 years and men were age ≥ 14; (c) both reported being in a romantic relationship with each other; (d) both reported being the biological parents of the unborn baby; (e) both agreed to participate in the study and (f) both were able to speak English and/or Spanish.

Study Procedures

A research staff member obtained Informed consent ~~was obtained by a research staff member~~ at the baseline appointment, which was conducted after 24 weeks gestation but before the baby was born. The couples separately completed a structured interview via audio computer assisted self-interviews (A-CASI) during this baseline appointment. A-CASI allows respondents to listen over headphones to spoken questions that are also displayed on the computer's screen.

After the baby's due date, a research assistant went to each affiliated hospital and collected birth outcome information from each participating woman's medical record. A small number of women did not deliver at an affiliated hospital.[1] In this case, the research assistant collected basic birth outcome information (e.g. birth weight, gestational age at delivery) directly from the baby's mother by calling her on the telephone. All procedures were approved by the Yale University Human Investigation Committee and by Institutional Review Boards (IRB) at study clinics. IRB approval to use the de-identified PARTNRS data was also obtained from the CUNY Graduate Center. Participants were paid $25 for their voluntary participation in this interview.

Commented [HJ5]: Each or was this for the couple?

b.2 Measures

Please see Appendix III-1 and Appendix III-2 for detailed item descriptions, and estimates of the validity and reliability of the measures used in the analyses for this chapter. All measures for this aim were assessed among both mothers and fathers at the baseline interview during pregnancy (after 24 weeks gestation).

Assessment of stress

[1] The number of cases where the birth outcome information was not abstracted from the mother's medical record, but rather from the mother's report is unknown due to a lack of documentation in study records; however it is estimated at less than 5%.

Table III-1 shows a detailed description of the relationship quality predictor variables. Three different stress measures were assessed via A-CASI at the baseline interview ~~(after the 24th week of pregnancy)~~ and included in this analysis. Stressful life events over the previous six months were measured using a modified 11-item version of Brugha and Cragg's Life Events Scale (LES).[49] Participants reported whether they experienced each item (yes/no), such as suffering a serious injury or assault and having money problems. Experiences of discrimination (referring to experiences "in general") were measured using Essed's Daily Life Experiences Scale.[50] Participants responded on a 6-point scale ranging from "Never" to "Once a Week Or More" for each item, such as "In general, how often are you observed or followed while in public spaces?" and "In general, how often are you ignored, overlooked, or not given service (in a restaurant, store, etc.)?" Perceived stress over the past month was measured using ten items from Cohen's Perceived Stress Scale.[83] Participants indicated how often they felt each item on a 5 point scale ranging from 0="never" to 4="very often," such as "In the past month, how often have you felt unable to cope with all of the things you had to do?" and "how often have you felt that difficulties were piling up so high that you couldn't overcome them?"

Assessment of Birth Outcomes

The baby's *birth weight* and *gestational age* at delivery were abstracted from the mother's medical record at delivery (or from the baby's mother if not available as described under *Study Procedures*). Gestational age was recorded in weeks and birth weight was recorded in grams.

Commented [HJ6]: Did you also dichotomize these?

Covariates

Several covariates were accounted for during model building and are described in detail in Appendix III-1. A priori hypothesized ~~Demographic~~ demographic confounders included maternal and

paternal household income, age, work/student status, and race/ethnicity, and maternal parity and baby's gender.

Clinical risk factors were also a priori hypothesized confounders. A summary score of five clinical risk factors /complications variable ranging from 0 to 5 was computed due to the low numbers of women with any one individual clinical risk factorsfactor. Women were given a value of 0=NNo and 1=yes for each of the five clinical risk factors: obese before pregnancy (based on calculated BMI >30 calculated from self-report of pre-pregnancy weight and height); a positive Chlamydia and/or Gonorrhea test at any point? during pregnancy (LCR test during study participation),); medical record indication of pre-eclampsia,; medical record indication of gestational diabetes,; and self-report on whether she received no any prenatal care prior to by the time of the interview, which is within the third trimester (self-report). (Might think about some other ways to code these, such as individual dummies—they don't seem to relate to one another in a way that is amenable to summing up.)

Mediator

Depressive symptoms over the past week were measured using 15 of the 20 items in the Center of Epidemiological Studies-Depression Scale (CES-D).[51] Participants responded on a 4-item scale ranging from 0="Less than 1 day" to 3="5-7days". Items included "during the past week I had crying spells" and "during the past week I felt depressed."

Commented [HJ7]: Was this only during study participation so the test was given at the third trimester visit?

Formatted: Font: Not Italic

Commented [HJ8]: How did you use the score – did you dichotomize to create 'depressed' vs. 'not depressed'?

Table III-1. Stress predictor and mediator variables

Construct	Measure	Description	Response Scale	Scoring
Stressful Life Events	Brugha and Cragg Life Events Scale (LES)[49] (adapted)	11 items assessing experiences of stress (e.g. having an illness, death in the family)	1=Yes, 0=No	-Responses summed to form an index -Higher scores correspond to more events (range: 0-11) (α = 0.65 w, 0.72 m)
Discrimination	Essed Daily Life Experiences Scale[50] (adapted)	20-items assessing experiences of discrimination (e.g. not being given service in store, being called insulting name).	6-point scale ranging from 0 ("Never") to 5 ("Once a Week or More")	-Responses summed to form a continuous scale -Higher scores correspond to more discrimination (range: 0-100) (α = 0.92 w, 0.94 m)
Perceived Stress	Cohen Perceived Stress Scale[52]	10 items assessed degree situations are stressful (e.g. how often nervous or stressed; unable to control important things)	5-point scale ranging from 0 ("Never") to 4 ("Very often")	-Responses summed to form a continuous scale -Higher scores correspond to more perceived stress (range: 0-40) (α = 0.77w, α = 0.74 m)
Depressive Symptoms	Center of Epidemiological Studies-Depression Scale (CES-D).[51] (adapted)	15 items assessed how often experienced the depressive feeling or thought (e.g. I felt depressed, had crying spells) -Five behavioral manifestations of depression items were removed	4-point scale ranging from 0 ("Rarely or none of the time (less than 1 day") to 3 ("Most of the time (5-7 days)")	-Responses summed to form a continuous scale -Higher scores correspond to more depressive symptoms (range: 0-45) (α = 0.84, α = 0.78 m)

b.3 Statistical Analysis

I generated ~~Descriptive~~ descriptive statistics to describe sample characteristics ~~were generated~~ using IBM SPSS Statistics (SPSS Corporation, City, State) ~~V22 to assess the characteristics of the sample population~~. I used IBM SPSS AMOS V22 ~~software was used~~ to construct ~~the~~ a latent stress ~~variable~~ measure from the four stress measures. I then used structural equation modeling (SEM) ~~,~~ to ~~determine~~ test the extent to which ~~ability of~~ the maternal and paternal latent stress variables ~~to~~ predicted gestational age at birth and birth weight after adjusting for a priori hypothesized confounders. I further ~~,~~ examined whether maternal depression explained any of the association between the latent stress variables and birth outcomes to test for it as a mediator. ~~Structural equation modeling (~~SEM~~)~~ simultaneously assesses direct, indirect and total effects of a system of variables on an outcome. ~~, i~~It can be tailored to account for clustering of data within couples, ~~it~~ can accommodate multiple correlated outcomes (such as birth weight and gestational age in this study) and ~~it~~ can ~~handle~~ include latent variables.[53,54] Therefore, SEM was ideal for use in this study.

Commented [HJ9]: Above it says three stress measures.

~~*Data Preparation*~~*Sample*

Of the 296 participants, seven men had substantial missing data (i.e. had at least one stress measure missing). Maternal and paternal demographic characteristics did not differ significantly among the men with missing data on the stress variables compared to those who were not missing data (not shown). Therefore, couples with men missing stress data were excluded. Fifteen additional couples were missing data for birth weight and gestational age at delivery and ~~, A~~another three ~~couples~~ were missing data on birth weight ~~only~~. Maternal and paternal demographic characteristics did not differ significantly between the couples missing ~~when the~~ birth outcomes data and those with this data (not shown) ~~were and were not available~~. ~~Therefore, t~~These 18 couples were also excluded. The final sample size was 272 couples who gave birth to 272 infants? Were there any twins?.

One birth weight outlier was identified using the Outlier Labeling Rule as described by Hoagline, Iglewicz and Tukey.[55] The value for this case (915 grams) was Windsorized to the next lowest value (1390 grams).[56] Five gestational age outliers were identified using the Outlier Labeling Rule. The values for these cases (27.14-34.00 weeks) were Windsorized to the next lowest value (34.57 weeks), respectively.[56]

Commented [JD10]: Not sure I understand this—these are not unfeasible gestational ages, correct?

Model Specification and Identification

I calculated Cronbach's alphas f~~F~~or discrimination, perceived stress and depression scales~~all stress measures (except stressful life events) and the depressive symptoms variable, coefficient alphas were calculated~~ to estimate the reliability of these scales~~ensure that they behave consistently with the expected psychometric properties~~ (Table III-1, column 5). Alpha values were ~~very good for all stress variables~~high (ranging from xx to xx). I did not calculate a Cronbach's ~~The~~ alpha ~~was not calculated~~ for the stressful life events measure because, as an index, a participant's endorsement of one item should not necessarily be related to the endorsement of another item if the events are independent.[57]

Because participants were part of couples (i.e. dyads) clustering effects were likely. I estimated Spearman's rank correlation coefficient (rho) ~~were evaluated~~ to determine the collinearity of dyad members' data (Table III-2). In the ~~measurement~~ SEM? model, covariances were drawn between the error terms of the maternal and paternal stress variables to account for clustering.

Commented [HJ11]: I would avoid the passive voice and use I did x, y and z.

Table III-2. Correlations between maternal and paternal stress predictor variables

Spearman's Rho				
		Men		
		Stressful life events	General discrimination	Perceived Stress
Women	Stressful life events	.22**	.06	.11
	General discrimination	.10	.14*	.13*
	Perceived Stress	.11	.03	.29**

*Correlation is significant at the 0.05 level (2-tailed)
**Correlation is significant at the 0.01 level (2-tailed)

Estimation

The model was estimated using maximum likelihood, which compared the likelihood of the given model to the likelihood of a model with perfect fit. This method was preferred because it is asymptotically unbiased and is scale invariant.[58] Unstandardized coefficients were calculated to allow for comparison of coefficients between mothers and fathers.[59]

Testing

Global fit indices recommended by Bollen and Long (1993),[60] and Blunch (2008)[54] were assessed. The overall chi squared test of model fit was calculated; however, because this fit index is sensitive to sample size, the Tucker Lewis Index (TLI), the Root Mean Square Error of Approximation (RMSEA) and the p value of close fit (PCLOSE) were also calculated.[54]

c. Results

c.1 Sample Description

The sample is described in detail in Table III-3. On average, the women in this study were 18.7±SD years old and their male partners were 21.3±SD, average age difference was xx±SD. Most of the participants were black (xx%) or Hispanic (xx%). Just over half of the women were in school or working, while nearly three-quarters of the men were in school or working. The average annual household income of women and men was quite low ($13,567 and $17,518, respectively). The average birth weight of the baby was 3,210.65±SD grams and the average gestational age at delivery was 39.22±SD weeks.

Commented [HJ12]: I would say what proportion of babies were considered LBW and what proportion were PTB as well. I think it would also help to describe how much variability there is in your stress and depression measures here

Table III-3. Characteristics of Sample Population (N=272)

	MOTHERS			FATHERS		
	N	**Mean**	**SD**	**N**	**Mean**	**SD**

[b]Data is missing for respondents who refused to answer these questions.

Commented [HJ13]: IT would help to know how much stress there was in this table – so include some information on your three stress measures as well as depression measures.

Commented [JD14]: Yes, the distribution of stress variables is very important to know.

Commented [HJ15]: Not sure what this is?

Commented [HJ16]: Not separated out – school vs. working?

Commented [HJ17]: This is confusing – how are they single if they are in a couple? Also shouldn't the married and living with partner match between the males and the females?

Commented [HJ18]: Neither cigarette use or alcohol use were mentioned above.

Commented [HJ19]: I would add proportion obese down here and then give the mean and SD of the clinical risk factors to match the text.

Commented [HJ20]: I would move this above to be with the baby characteristics – agan are all of them singleton births?

*P<0.5 **P<.01

c.2 Latent Variable Model Building

The first step in the analysis was to evaluate whether the three measures of stress (stressful life events, general discrimination and perceived stress) could be represented by a single, higher-order latent factor called maternal and paternal "stress." Separate stress latent factors were created for men and women. Based on the significant correlations between maternal and paternal measures of stress (Table III-2), I allowed correlations between the maternal and paternal residuals for each measure as well as correlations between maternal and paternal latent "stress" factors.

All path coefficients between the stress measures and the stress factor were statistically significant and greater than 0.39 (p's < .05) (Table III-6). The model of the higher-order latent stress factors exhibited good fit (X^2 =11.25, df =5, p= 0.05; TLI= 0.91; RMSEA= 0.07 (0.01-0.12); PCLOSE= 0.24).

Table III-6. Factor loadings onto women's and men's stress latent variables.

Women's Stress Latent	Estimate
General Discrimination	.91
Stressful Life Events	.52
Perceived Stress	.39
Men's Stress Latent	
General Discrimination	.67
Stressful Life Events	.51
Perceived Stress	.79

Factor Structure Invariance by gender and race/ethnicity

I tested the possibility that the way the stress measures load onto the stress latent factors could differ between men and women. The model fit did not differ significantly when constraining the loadings of each measure on to the latent stress constructs to be equal for men and women compared to a model when the measure loadings were allowed to vary by gender (X^2_{diff}=0.80, df =2, p=0.67).[59]

Therefore, I concluded that the measures of stress loaded similarly ~~on to~~for the maternal and paternal stress latent factors.

I also tested the possibility that the factor structure differed by race/ethnicity. Because the "white" group was small, I compared the factor structures of blacks versus Hispanics. The model fit did not differ significantly when constraining the latent factors to be equal (X^2_{diff}=6.45, df =9, p=0.70).[61] Therefore, I concluded that there was configural invariance by race/ethnicity.

c.3 Influence of the latent stress factors on birth weight and gestational age

Next, I created a model to examine the influence of the maternal and paternal latent stress factors on birth weight and gestational age. The model exhibited good fit (X^2 =15.87, df = 13, p=.26; TLI= 0.98; RMSEA= 0.03 (0.00-0.07); PCLOSE= 0.76). The path from paternal stress to gestational age was significant (B=0.30, P=.03) and the path from paternal stress to birth weight was marginally significant (B=75.07, P=.06). The paths from maternal stress to gestational age (B=0.01, P=.95) and birth weight (B=-31.96, P=.38) were not significant.

Commented [HJ22]: I would specify the direction of the association not just the statistical signficance

Commented [HJ23]: The direction here makes sense though

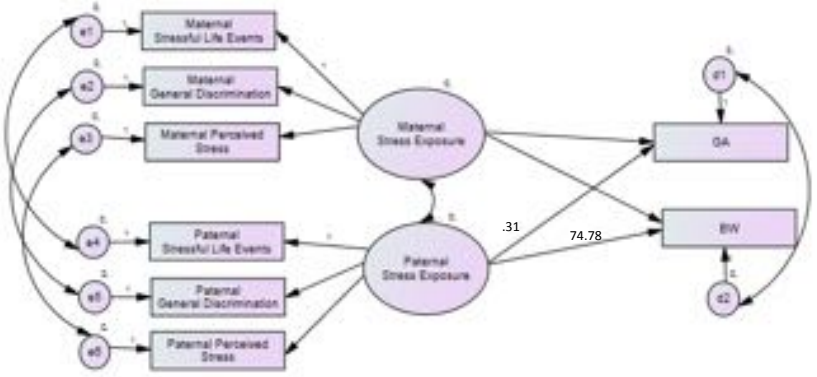

Figure III-2. Structural equation model examining the impact of the latent maternal and paternal stress factors on birth weight and gestational age at delivery accounting for all covariates. All path coefficients displayed are statistically significant (P<.05).

Commented [JD24]: It would be helpful to see all of the coefficients, perhaps bolding the significant ones?

A model adding in all maternal and paternal covariates also exhibited good fit (X^2 =197.93, df=110, p<.001; TLI= 0.88; RMSEA= 0.05 (0.04-0.07); PCLOSE= 0.27). The path from paternal stress to gestational age remained significant (B=0.31, P=.03) and the path from paternal stress to birth weight remained marginally significant (B=74.78, P=.05). The paths from maternal stress to gestational age (B=-0.02, P=.87) and birth weight (B=-44.03, P=.20) remained not significant.

To quantify the impact of paternal stress on gestational age, I used regression imputation to create values for the latent variable of paternal stress.[61] Fathers with the highest level of stress (splitting the imputed paternal stress variable at the median) had babies that were born less than one day later (M=39.49, SD=1.29) compared to babies born to fathers with low levels of stress (M=38.97, SD=1.29, t=-2.42, P=.02). Fathers with the highest level of stress also had babies that were 113.42 grams heavier (M=3,269.10, SD=476.81) compared to babies born to fathers with low levels of stress (M=3,155.68, SD=577.31, t=-1.77, P=.08), although the difference was only marginally significant.

c.4 Mediation by depressive symptoms

Next, I examined mediation of the effect of paternal stress on birth outcomes by maternal and paternal depressive symptoms by entering maternal and paternal depressive symptoms variables into the model that also accounted for all covariates (Figure III-3). The model fit was acceptable (X^2 =304.18, df = 151, p<.001; TLI= 0.85; RMSEA= 0.06 (0.05-0.07); PCLOSE= 0.03). To examine mediation by depressive symptoms, I first explored whether paternal stress was associated with his own and his partner's depressive symptoms. Greater paternal stress was only associated with his own depressive symptoms (B=6.22, P<.001). Second, I examined whether paternal depressive symptoms were associated with either birth outcome. Paternal depressive symptoms were not significantly associated

Commented [HJ25]: I would describe what you adjusted for again here.

Commented [HJ26]: But the betas are in the opposite direction right – gestational age and birth weight increased as paternal stress increased?

Commented [HJ27]: But the direction here is what you would expect, right?

Commented [JD28]: Later?

with gestational age (B=-.03, P=.37) nor birth weight (B=-4.38, P=.60). The direct associations between paternal stress and gestational age (B=.46, P=.14) and birth weight (B=133.97, P=.13) were insignificant.

Commented [HJ29]: I don't understand this last sentence – I thought the direct effects were significant as described above?

Commented [HJ30]: Interesting findings - again will help to know how much variability there was in stress and depression to put this in context – was stress generally high among everyone for example?

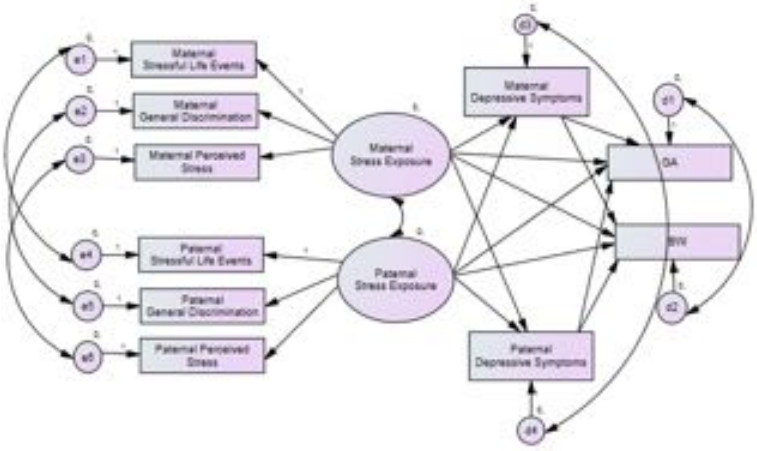

Figure III-3. Structural equation model examining mediation of the association between latent paternal stress factors on birth weight and gestational age at delivery by maternal and paternal depressive symptoms. All path coefficients displayed are statistically significant (P<.05).

d. Discussion

Contrary to many published studies, this analysis did not find a significant association between young expectant mother's stress during pregnancy and the gestational age at birth and birth weight of her baby.[8–13] This analysis did find, however, that paternal stress during pregnancy was significantly *positively* associated with gestational age at birth—a finding that was contrary to my hypothesis that paternal stress would be negatively associated with the birth outcomes. While the results were in the opposite of the expected direction, they suggest that paternal experiences during his partner's pregnancy are associated with his baby's birth outcomes and his experiences should not be ignored. In addition, the associations between paternal stress and the birth outcomes persisted after controlling for several important confounders, including obstetric risk and demographic characteristics.

Commented [HJ31]: [redacted] while not significant the estimate of the direction of maternal stress is as hypothesized – again I am wondering about power depending on how much variability there was in maternal stress levels.

Lack of effect of maternal stress on birth outcomes

The lack of effect of women's stress on birth outcomes was contrary to much of the published evidence showing a significant negative effect of stress on birth outcomes.[8–13] The women in this study generally had low incomes ($13,500 household income) and were rather young to be having a baby (in American society). These young women were likely all under a high amount of stress as they grappled with potential relationship issues and financial challenges, while concurrently traversing the road to parenthood and adulthood. It is possible that all of the expectant women were under a high amount of stress and that there was not enough variability in the stress measure to identify an association with the birth outcomes.

Commented [HJ32]: Aha – exactly – so it would help if you show us how much variability there was in the scales earlier.

In addition, the stress assessments used in this study did not include items that were specific to the stressors of pregnancy, which research has suggested may be a stronger predictor of birth outcomes among expectant mothers compared to general life event stress and perceived stress.[62] This may be an additional reason that I did not see an effect of maternal stress on birth outcomes. Pregnant women

(and their partners) may experience life events and worries that are specific to being pregnant, such as concerns about financially supporting a baby or worries about the health and development of their baby. Not including these relevant stressors may have led to inaccurate estimates of the level of stress and its impact on birth outcomes in this study.[63]

Positive effect of men's stress on birth outcomes

The lack of effect of maternal stress on birth outcomes coupled with the *positive* effect of paternal stress on birth outcomes suggests that there may be an alternative model for the stress processes among couples and how these processes influence birth outcomes. My original hypothesis was based on the traditional theory of human stress characterized mainly by the fight-or-flight response, in which a stressor activates the HPA and the immune/inflammation pathways within an expectant mother, which could affect fetal growth and initiate premature birth.[8,9] This theory assumes that the physiological and behavioral cascade of events that follows a stress exposure is the same for men and women. However, as the "tend and befriend" model of female stress response proposes, maternal responses to stress may not be best characterized solely by the fight-or-flight response.[64,65]

The "tend and befriend" model suggests that under conditions of stress, women are more likely than men to affiliate with others and seek social support than men.[64–66] In contrast, men are more likely to display behaviors that are fight-or-flight related under conditions of stress, such as aggressive behavior and substance use. These gender differences in behavioral stress responses are thought to be informed by the human attachment system, which is activated particularly in times of stress. Research has shown that women tend to display more attachment anxiety than men, and men tend to display more attachment avoidance.[67] As such, under conditions of stress, women in this study may have sought ~~out~~ substantial support from the father of their baby. This maternal support seeking behavior may have benefitted the well-being of the expectant mother; however, this increased support seeking from the

Commented [HJ33]: I am still confused if you included cigarette and alcohol use in your model – would have been mediators I would think?

expectant mother may have caused her male partner more stress, as males are less likely to use affiliative behavior as a method to reduce stress. [64–66] Thus, the young men in this study may have provided more support to their expectant partner in this time of stress, which benefitted the expectant mother's health and well-being, and ultimately the baby's well-being, but at the cost of their own increased stress. In support of this hypothesis, I conducted a post-hoc analysis using imputed values of the stress latent variables.[61] I found that women's stress was significantly correlated with her own attachment anxiety (B=.41, P=.01),[3] and women's attachment anxiety was significantly correlated with men's stress (B=.19, P=.01). Unfortunately, the original study did not include a measure of support seeking.

The "tend and befriend" model also suggests based on studies of rodents, that the *initial* neuroendocrine response to stress may be similar among men and women—the rapid activation of the HPA and the immune/inflammation pathways—however, there may be other gender differences in the neuroendocrine response after the initial reaction. Research has shown that oxytocin release in the response to stress is greater among females than males. Oxytocin, often referred to as a "love drug" may reduce feelings of stress by countering the initial HPA and the immune/inflammation responses and enhance affiliation (i.e. support seeking) behavior.[65]

Another potential explanation for this positive effect is that the women whose partners had the most stress are less involved with their partner and more involved with their own family, who provide compensating support for the expectant mother. A post-hoc analysis using imputed values of the paternal stress latent variable[61] found that men with high levels of stress (median split) reported greater depression, lower optimism, lower life satisfaction, and more smoking, alcohol use and marijuana use. Perhaps the expectant women whose partners are highly stressed and exhibit these unhealthy behaviors rely more on their own family for support, who compensate and ultimately help support a

[3] Attachment anxiety was measured using the Experiences in Close Relationships Inventory (ECRI) by Brennan, Clark and Shaver (1998)[68]

healthy pregnancy. Post-hoc t-tests showed that women whose male partner had the highest stress were less likely to receive financial support from her male partner and more likely to receive financial support from her own parent. These women with highly stressed partners also reported lower dyadic cohesion. The men with the greatest stress also report more attachment avoidance and anxiety, which could ultimately deter a relationship from being close. In fact, the men with the highest level of stress have lower intensity of feelings for their partner.

Unfortunately, the original study that this data come from did not have a strong measure of "closeness" of the couple. A proxy for closeness of the couple may be the living arrangement of the couple—and specifically whether the expectant woman lives with her own mother or not. A post-hoc analysis found that the effect of men's stress on gestational age at birth differed significantly based on the expectant woman's living arrangements ($Z=-1.79$, $P<.05$). When the mother of the baby lived with her own mother (and not the baby's father), men's stress did not have a significant effect on gestational age ($B=-.09$, $P=.63$); however, when she lived with the baby's father (with her own mother or not), men's stress had a significant positive effect on gestational age ($B=.40$, $P=.04$).

Given that men's stress still had a positive effect on birth outcomes among the "closest" couples, the "tend and befriend" model is still consistent with these outcomes. When couples are closer, the men may be a stronger support system for the expectant mother, which could benefit her health and well-being and ultimately the health of the baby. However, this support of the expectant mother may come at the expense of higher stress for her father. While ~~the importance of~~ social support for pregnant women and new mothers is considered important~~paramount~~ in our society, we generally pay little attention to expectant and new fathers. Interventions that support not only expectant and new fathers, but also the relationship between expectant and new parents may be important to the health and well-being of the whole family system.

Commented [JD34]: So there is no causal story about the father's high stress being protective for the baby? Maybe they care more about the pregnancy?

Commented [JD35]: I'm just a bit confused on what the implications are given the findings for men in the opposite direction.

Lack of mediation by depressive symptoms

Depressive symptoms did not mediate the effect of paternal stress on birth outcomes. In this study, there was no evidence of stress and strain cross-over between members of the couple.[69] Maternal and paternal experiences of stress were not associated with their partner's depressive symptoms. This may be due to the fact that these couples are young, nearly all unmarried and 46.7% of the young mothers still live with their own mothers. Evidence has shown that the closeness of a couple may moderate the cross-over effect, with closer couples experiencing more cross-over of the effects of stress from one member to the other.[42] Many of the couples in this study may not have had close enough relationships for paternal stress to cross over and affect maternal feelings of stress and well-being. In a post-hoc moderated mediation analysis,[61] however, the effect of men's and women's stress on their partner's depressive symptoms still did not differ based on the expectant mother's living arrangement ($Z=.29$, $P>.05_{\text{men's effect on women}}$; $Z=-.40$, $P>.05_{\text{women's effect on men}}$).

Concluding remarks and future research directions

Future studies would be strengthened by the inclusion of stress appraisals and perceptions. What is stressful for one person may not be stressful for another, and therefore the likelihood of reporting a stressful event may be affected by an individual's appraisal of the stressor.[70] Measures of stress appraisals and perceptions could ascertain the individual's perception and evaluation of potential harm posed by a specific external demand (i.e. stressor) and their ability to cope with the demand.[71] The inclusion of biological indicators of stress responses may also help elucidate this gap between whether a stressor actually has a physiological effect on the expectant mother that could ultimately affect the health and development of the fetus.[14] And one needs more power to detect effects, for sure!

Despite the fact that the findings from this investigation may leave us with more questions than answers about paternal effects on birth outcomes, even including father's experiences and feelings within birth outcome research is a step in the right direction as there has been virtually no investigation

in this arena. The findings from this study suggest that there *is* a relationship between birth outcomes and men's experiences during pregnancy; however, the lack of consistency of the findings with accepted theory on how stress affects health indicates that more research is necessary. This is the first analysis to explore the effect of *paternal* stress on birth outcomes, and the pathways through which he has an effect. This analysis also assessed direct report of stress exposures and responses from the fathers, avoiding measurement error associated with using maternal reports of paternal experiences.

The analytical techniques used in this research also strengthen the analyses. The analysis accounts for the correlated nature of maternal and paternal reports, while maintaining the strength of the total sample size (i.e. without conducting the analyses separately by gender). In addition, structural equation modeling allows for the simultaneous assessment of multiple hypotheses involving complex pathways, while parceling out measurement error.

This is the first study in the literature to date that explores the role of expectant father's experiences of stress during his partner's pregnancy on his child's birth outcomes using direct report from the fathers and strong analytical techniques. The study demonstrates that paternal experiences of stress during his partner's pregnancy are significantly associated with birth outcomes, but not in the direction that is consistent with conventional theory of how stress is related to one's own and one's partner's health and well-being. This study offers a unique perspective building on the "tend and befriend" model to explain how greater paternal stress during pregnancy may be positively associated with his baby's birth outcomes. Future studies that further explore alternative models for how paternal experiences and well-being during pregnancy affect his baby's birth outcomes are warranted.

Appendix III-1. Outcome and Confounder descriptions and details

Construct	Measure	Description	Response Scale	Time Points Assessed	Time Frame Referenced	Summary Measure
Birth Outcomes						
Birth Weight	Weight at birth in grams	--	--	At birth via labor log	--	Continuous
Gestational Age at Birth	Weeks pregnant at birth	--	--	At birth via labor log	--	Continuous
Mediator						
Depressive Symptoms	Center of Epidemiological Studies-Depression Scale (CES-D).[51] (adapted)	15 items assessed how often experienced the depressive feeling or thought (e.g. I felt depressed, had crying spells) -Five behavioral manifestations of depression items were removed	4-point scale ranging from 0 ("Rarely or none of the time (less than 1 day") to 3 ("Most of the time (5-7 days)")	Base (24-40 weeks pregnant)*	Past Week	-Responses summed to form a continuous scale -Higher scores correspond to more depressive symptoms (range: 0-45) (α = 0.84, α = 0.78 m)
Confounders (Maternal and Paternal)						
Age	--	Summary variable created by from birth date.	--	Baseline	Current	Continuous
Household Income	--	Asks: " What is your household income (the total income before taxes earned by all members of your household) per year)	0 $0-$4,999 1 $5,000-$9,999 2 $10,000-$14,999 3 $15,000-$19,999 4 $20,000-$24,999 5 $25,000-$34,999 6 $35,000-$49,999 7 $50,000 or more	Baseline	Current	Categorical

Construct	Measure	Description	Response Scale	Time Points Assessed	Time Frame Referenced	Summary Measure
School or Work Status	--	A summary measure created to indicate if the participant is either in school and/or working at least part-time.	1=Yes 0=No	Baseline	Current	Dichotomous
Race/Ethnicity	--	Variable constructed from two questions, the first asking their race (select all) and the second asking if they are Hispanic or Latino. Coded as black if selected black (regardless of ethnicity), Hispanic if selected Hispanic or Latino (regardless of race), white if they selected white only. All other participants were grouped into the "Other" category due to low sample size.	1= White 2= Black 3= Hispanic 4= Other	Baseline	Current	Categorical
Confounders (Maternal Only)						
Parity	--	Question in baseline interview	--	Baseline	Current	Continuous
Clinical Risk	--	Variable constructed from 5 yes/no items: Presence of gestational diabetes and pre-eclampsia as indicated on the labor log, having a pre-pregnancy BMI classified as obese based on height and weight questions from baseline interview, reporting no prenatal care by the time of the baseline interview and a positive urine test for chlamydia and/or Gonorrhea at the baseline interview.		Baseline and at birth via labor log	During Pregnancy	Continuous (range 0-5)

BMI pre-pregnancy	--	Calculated from participant report of pre-pregnancy weight and current height.	--	Baseline	Pre-Pregnancy	Continuous
Baby's Gender	--	--	1=Male 2=Female	At birth via labor log	--	Dichotomous

Appendix III-2. Variable details, items, validity and reliability

Stressful Life Events

This 11-item scale was adopted from the 12-item Life Events Scale, which was created by Brugha and Cragg (1990).[49] This scale asks participants if they have had stressful life events. 10-items out of the original 12-items were incorporated into the questionnaire, however, three original items were revised: "You became unemployed or you were seeking work unsuccessfully for more than one month" was changed to "In the past 6 months, did you become unemployed or were seeking work unsuccessfully," "You had a major financial crisis" was changed to simply "In the past 6 months, did you have money problems," and "You had problems with the police and a court appearance" was changed to "In the past 6 months, did you have problems with the police." Additionally, two questions were combined and changed into one question: "Your parent, child or spouse died" and "A close family friend or another relative (aunt, cousin, grandparent) died" were combined and shortened into "In the past 6 months, did a close family member or friend die."

Additionally 2-items were added for the research study including: "In the past 6 months, did you have problems at work or school," and "In the past 6 months have you moved." Two of the original items from the LEQ were also omitted from the research study including: "You had a separation due to marital difficulties" and "You were sacked from your job."

The 11 items were summed to form a total score.

The test-retest reliability of the Life Events Scale is reported as .84 for a three-month period and .66 for a six-month period. Data on internal consistency are not available. Concurrent validity estimates were derived from the concordance between inpatient psychotic patients' identification of stressful events and those identified by a significant other; there was a 90% agreement when assessed at a three-month period and a 70% agreement when assessed at six months. The authors also used an extensive interview of stressful events as a base rate and showed that the LEQ was sensitive to the identification of stressful events.[49]

Items:

In the past 6 months:

have you suffered a serious illness, injury, or assault?
did a close relative suffered a serious illness, injury, or assault?
did a close family member or friend die?
you break off a steady relationship?
did you have a serious problem with a close friend, neighbor, or relative?
did you become unemployed or were seeking work unsuccessfully?
did you have money problems?
did you have problems with the police?
did you have problems at work or school?
was something you valued was lost or stolen?
have you moved?

General Discrimination

An adapted version of the Daily Life Experiences Scale was used to assess participant experiences of discrimination.[50] The original Daily Life Experiences Scale has 20-items, however the adapted version used 19 of those items. The items how often the survey taker has experienced discrimination (e.g. Being observed or followed in public places). The response scale ranged from 0 to 5: 0= "never," 1= "less than once a year," 2= "a few times a year," 3= "about once a month," 4= "a few times a month," and 5 = "once a week or more." Responses to items were summed to form a total score ranging from 0-95.

Four items from the original scale were also revised, including "Being mistaken for someone else of your same race (who may not look like you at all)" was changed to "mistaken for someone else (who may not look like you at all)" and "Being asked to speak for or represent your entire racial/ethnic group (e.g. What do ___people think?)" was changed to "asked to speak for or represent an entire group (e.g. What do ___people think?), "Overhearing or being told an offensive joke or comment" was changed to "hear an offensive joke or comment" and "Being avoided, others moving away from you physically" was changed to "avoided, or do others move away from you physically." There was also one item added: "Someone in the health system showed you hostility or a lack of respect, refused you service or paid less attention to you compared with others" and one item was omitted "Being considered fascinating or exotic by others."

Items

In general, how often are you ignored, overlooked, or not given service (in a restaurant, store, etc.)?
In general, how often are you treated rudely or disrespectfully?
In general, how often are you accused of something or treated suspiciously?
In general, how often are you do others react to you as if they were afraid or intimidated?
In general, how often are you observed or followed while in public places?
In general, how often are you treated as if you were "stupid", being "talked down to"?
In general, how often are your ideas or opinions minimized, ignored, or devalued?
In general, how often do you hear an offensive joke or comment?
In general, how often are you insulted, called a name, or harassed?
In general, how often do others expect your work to be inferior?
In general, how often are you not taken seriously?
In general, how often are you left out of conversations or activities?
In general, how often are you treated in an "overly" friendly or superficial way?
In general, how often are you avoided, or do others move away from you physically?
In general, how often are you mistaken for someone who serves others (i.e., janitor, bed boy, maid)?
In general, how often are you stared at by strangers?
In general, how often are you laughed at, made fun of, or taunted?
In general, how often are mistaken for someone else (who may not look like you at all)?
In general, how often are you asked to speak for or represent an entire group (e.g., "What do _____ people think?")?
In general, how often has someone in the health system showed you hostility or a lack of respect, refused you service or paid less attention to you compared with others?

Perceived Stress

This 10-item Perceived Stress Scale (PSS) assessed the degree to which individuals perceive situations in their lives to be stressful.[72] The items focused on how unpredictable, uncontrollable, and overloaded individuals perceive their lives to be. The participant was asked to rate the perceived level of stress in their life during the past month (e.g., "How often have you felt: upset by something that happened unexpectedly, able to control irritations in your way, and on top of things"). Possible responses ranged from 0 to 4, with 0 = "never," 1 = "almost never," 2 = "sometimes," 3 = "fairly often," to 4 = "very often." Positive items were reverse-scored. Items were summed to form a total score ranging from 0 to 40, with higher scores corresponding to greater perceived stress.

Early studies found that the 14-item measure has good psychometric properties. For example, Cohen and colleagues (1983) reported coefficient alpha reliabilities of .84, .85, and .86 across two samples of college students and a community smoking cessation group.

Early studies also found that the PSS was moderately related to responses on other measures of appraised stress, as well as to measures of potential sources of stress as assessed by event frequency. Studies also found that the PSS provided better predictions for individual behavior than did life-event scales of psychological symptoms, physical symptoms, and utilization of health services. Because levels of perceived stress should be influenced by daily hassles, the predictive validity of the PSS is expected to fall off rapidly after four to eight weeks.[72]

Items

In the past month, how often have you felt…

Upset by something that happened unexpectedly?
Unable to control important things in your life?
Nervous and stressed?
Confident in your ability to handle your personal problems? r
That things were going your way?r
Unable to cope with all of the things you had to do?
Able to control irritations in your life? r
On top of things? r
Angry because of things that happened that you couldn't control?
That difficulties were piling up so high that you couldn't overcome them

r=reverse coded

Depressive Symptoms

Fifteen items were adapted from the 20-item Center for Epidemiologic Studies Depression Scale (CES-D), which was developed by Radloff (1977).[51] The items address whether the participant felt or exhibited the behavior of the major components of depression in the previous week (e.g. I felt that everything I did was an effort). As the original CES-D scale specified, participants were asked to respond using: 0= "rarely or none of the time (less than 1 day)," 1= "some or a little of the time (1-2 days)," 2 = "Occasionally or a moderate amount of the time (3-4 days)," and "Most or all of the time (5-7 days)." The five behavioral manifestations of depression items were removed, including item did not feel like eating, trouble keeping mind on what I was doing, everything I did was an effort, my sleep was restless, and could not get going.

The CES-D scale discriminates strongly between patient and general population groups, be sensitive to levels of severity of depressive symptomatology, and reflect improvements after psychiatric treatment. In addition, it should correlate well with other scales designed to measure depression, and be related to a felt need for psychiatric services.[51]

The CES-D scale has been found to have high internal consistency (coefficient alpha =.85 in the general population and .90 in the patient sample); studies found that both inter-item and item-scale correlation were higher in the patient sample than in the population samples. The scale also has moderate test-retest reliability (r between .45 and .70). Test-retest correlation was higher for shorter time intervals.[51]

Items

During the past week…

I was bothered by things that usually don't bother me.
I felt I could not shake off the blues even with help from my family or friends.
I felt that I was just as good as other people.r
I felt depressed.
I felt hopeful about the future. r
I thought my life had been a failure.
I felt fearful.
I was happy. r
I talked less than usual.
I felt lonely.
People were unfriendly.
I enjoyed life. r
I had crying spells.
I felt sad.
I felt that people disliked me.

Chapter IV. Stress and Behavioral Risk among Young Expectant Couples

Abstract

Many unhealthy behaviors, such as substance use and sexual risk behavior, develop during adolescence and evidence shows that stress is a contributing factor. This association has not been established among pregnant adolescents and little attention has been paid to male partners. This study examined the association between maternal and paternal experiences of stress during pregnancy with one's own and one's partner's health behaviors among 294 young expectant couples. Multilevel modeling showed that one's own experiences of stress were associated with more unhealthy behaviors for both members of the couple?. Paternal stress was predictive of more maternal conduct problems and more? Less? protected sex, while maternal stress was predictive of less paternal substance use and more protected sex. These findings highlight the importance of social relationships and interactions ~~in predicting~~on health behaviors.

Keywords: Stress, Couples, Risky Behavior, Substance Use, Pregnancy, Adolescents

a. Introduction

Learning to cope with psychosocial stress is a fundamental component of human development. Decades of research has shown us that exposure to stressors and the ways in which adolescents manage their emotions, thoughts and behaviors influence their mental and physical health.[1,2] Much research has helped elucidate the types of stress adolescents experience and the ways in which they cope, which can include unhealthy behaviors such as substance use. There has been little investigation, however, into the basic nature of stress and coping among adolescents who are expecting a baby. This population is ~~an~~ important ~~population~~ because their responses to stress (take for example, smoking) carry implications for the unborn child. In addition, coping styles (whether healthy or unhealthy) are sensitive to situational factors and developmental changes, such as pregnancy. Thus, coping behaviors exhibited during this sensitive period of development for the fetus? may affect the child's health later in life? Or do you mean for the parent?. Pregnancy ~~is also often viewed as~~may further provide a window of opportunity for intervention—expectant parents are often motivated to change or establish healthy behaviors for the good of their child[3]—and pregnancy may be an opportune time to help couples learn to better manage stress in an effort to support their health and their relationship as parents. We need better information, however, about the nature of the stressors that *expectant* adolescents experience and their responses in order to inform ~~more~~ effective interventions.

The experience of becoming a parent is a major life transition that may elicit many new stressors not only for young women, but also for the fathers of their baby. Despite the fact that pregnant adolescent females in the United States? are usually unmarried, many still have a relationship with the baby's father during pregnancy and therefore, these young men are also experiencing the major life transition of becoming a parent. Substantial research has shown us that social support can improve coping and buffer the effect of stress on well-being, and that romantic relationships can be a significant source of this much needed social support. Studies have also shown that a romantic partner's

Commented [HJ1]: reference

Commented [HJ2]: also a reference

Commented [HJ3]: e.g. refs

experiences of stress can cross over and affect one's own well-being. [4,5] Despite the interpersonal nature of stress and coping, and the fact that romantic relationships are present and important among pregnant adolescents, few studies of adolescent experiences of stress during pregnancy include the direct report of experiences and behavioral responses of the baby's father.

This paper uses stress and coping theory, and stress and strain cross-over theory to predict that expectant adolescents' and young adults' own experiences of stress are associated with their own *and their romantic partner's* health behaviors.

Stress and coping theory

Extensive research has demonstrated a consistent association between stress and health behaviors. This research is based on the hypothesis that people use health behaviors to cope with the distress that they experience. Individuals experience stress when demands exceed the resources the individual has to deal with the demands.[6] When individuals appraise a stressor as harmful, threatening or challenging, they use coping strategies to regulate the stress they experience.[1,7] Some of the coping mechanisms are adaptive and promote health and well-being, such as *active coping* (addressing or altering a stressor through active problem solving, ~~etc.~~) and *support seeking* (obtaining emotional support from a social network). Other coping mechanisms may lead to behaviors and emotions that can lead to poor health and well-being, such as *disengagement* (avoiding, withdrawing from or denying a stressor) and *distraction* (doing things that take the mind off the stressor).[1,7,8] Negative health behaviors, including substance use, risky sex, and venting anger (which could lead to conduct problems), can serve as a way for adolescents to withdraw from or keep their mind off a stressor, reduce emotional distress or release negative feelings.[9]

Commented [HJ4]: again ref?

Adolescents and young adults may also use negative health behaviors to cope with new and challenging stressors because they may not have developed healthier coping strategies. Adolescent's problem solving abilities, regulation of emotions, empathy and perspective-taking ability are still evolving during this developmental period.[10] Thus, adolescents may use negative health behaviors as coping mechanisms because they have not learned to employ other more adaptive coping strategies, such as identifying and actively pursuing alternative solutions.

Additionally, there is evidence that men and women have different reactions to stress. Studies have found that men are more likely to exhibit externalizing coping behaviors, such as substance use, in response to stress, while women are more likely to exhibit internalizing behaviors or affect (e.g. depressive symptoms) in response to stress.[11,12] The "tend and befriend" model of the stress response proposes that under conditions of stress, men are more likely than women to display "fight-or-flight" related behaviors, such as substance use and aggressive behaviors. This model also suggests that stress is more likely to cause women to affiliate with others and seek social support.[13–15]

Sources of stress and evidence of the impact on adolescent and young adult health behaviors

Adolescents and young adults experience stressors that emanate from various life domains, including close relationships (e.g. a fight with a romantic partner) and general personal hardships (e.g. having something important stolen).[2,16] For adolescents and young adults who are racial and/or ethnic minorities, live in urban areas and are from a low socioeconomic status (SES), daily stressors often extend beyond these typical developmental challenges. This population is disproportionately affected by other more severe and chronic stressors, such as neighborhood problems, racism and discrimination.[17] Coping strategies that are typically viewed as the most adaptive and produce the most positive outcomes, may not be realistic or even safe for adolescents within these circumstances. For example, one study found that active coping in response to exposure to violence was associated with increased

Commented [HJ5]: only urban areas? Wouldn't this be in rural areas too?

aggression among impoverished urban adolescents.[18] In the face of chronic and severe stressors that adolescents have little control over, such ~~h~~as discrimination and neighborhood problems, avoidant coping strategies (such as substance use as a method of disengagement and distraction) that afford them some transcendence from the day to day burden of stress may actually be an adaptive response and even have some benefits.[17,18]

Substantial evidence, discussed below, has demonstrated a link between experiences of stress in each of these domains and negative health behaviors among adolescents and young adults. Neighborhood problems disproportionately affect minority and low income communities and have been consistently linked to negative health behaviors among adolescents. Neighborhood problems, such as vandalism, rundown buildings, drugs and fights in the streets, become chronic stressors that may elicit negative coping mechanisms among adolescents living in the neighborhood. [19,20] For example, Lanctot and Smith (2001) found that among adolescent girls, parent-reported neighborhood disorganization was related to the adolescent's earlier sexual activity [21]. In addition Koweleski-Jones (2000) reported that perceived neighborhood problems were related to deviant behavior [22]. Among a sample of adolescents in Los Angeles, the perception of their neighborhood as dangerous was related to more oppositional defiant disorder and conduct disorder [23].

Experiences of discrimination have also been linked to negative health behaviors among adolescents. A nationally-representative survey of African American adolescents found that 87% experienced at least one source of discrimination in the previous year [24]. Several studies among adolescents and young adults show that experiences of discrimination predict greater smoking [25], other substance use [26,27], and sexual risk behaviors [28,29].

Discrete life stressors or personal hardships, referred to as stressful life events, are also common among adolescents and young adults. These stressful life events, such as losing a job or having something stolen, have been consistently associated with smoking [27,30,31], and alcohol use [27] among

adolescents and young adults. Further, among adolescents, experiencing more stressful life events has also been associated with greater conduct problems [32] and high risk sexual behavior [33,34].

Other discrete stressors stemming from important social relationships (e.g. parents and romantic partners) can have a significant influence on adolescent and young adult behavior. During adolescence and young adulthood, social relationships within and outside of the family, including romantic relationships, are extremely important [35]. Acute social-relationship stressors, such as family conflict [34] and romantic relationship dissolution [36] have been related to more substance use among adolescents and young adults.

Stress and the effects on health behavior among pregnant adolescents and young adults

Another important factor impacting the stress experienced by adolescents and young adults is their experience of pregnancy. Ethnic and/or racial minority adolescents and young adults experience a disproportionately high pregnancy rate [37]. Pregnancy can be a stressor for an expectant parent of any age or sex [38,39]. Pregnancy involves significant emotional and physical demands. It is also a major life transition that elicits many stressors, such as concerns over finances, health, and relationships with a romantic partner and family. For adolescents and young adults, the transition to parenthood may further overload coping resources and be exceptionally stressful [40,41]. This stress may lead to engaging in poor health behaviors, even among expectant mothers who intended to abstain from substance use during pregnancy. Many studies have demonstrated that maternal stress during pregnancy is associated with poor maternal health behaviors (e.g. smoking and substance use) [42,43], although these studies have been conducted among adult women.

There is very little research exploring experiences of stress and health behaviors among expectant fathers (of any age), despite the fact that a partner's pregnancy is also a major life transition for expectant fathers who may also have concerns over many issues, including finances and

relationships. A young man's experiences during pregnancy may impact his own health and behavior, as well as his pregnant partner's behavior, carrying implications for the health and development of their child. Substantial evidence has shown that social relationships have important influences on our health and well-being [44]. A majority of expectant female adolescents and young adults are involved with the baby's father during pregnancy [45], and therefore her romantic partner likely has an important influence on her during her pregnancy [46]. Despite this fact, the paternal experience during pregnancy has largely been ignored in the literature, and when it is acknowledged, it is usually reported by the expectant mother, introducing potential measurement error.

Stress and strain cross-over: theory and evidence

While there is substantial evidence demonstrating demonstrates that experiences of stress are predictive of one's own health behaviors, there is also some evidence suggests that experiences of stress can also cross-over and affect the well-being of one's romantic partner. [4,5,47] For example, a woman's partner's experiences of stress have been associated with increases in her own depressive symptoms.[4] It is thought that stress can be transferred from one person to the next through the socio-emotional process of empathetic distress, or the "emotional involvement in the problems and distressed feelings of a relationship partner, to the point of taking on the partner's emotional distress and experiencing it as one's own." [48] While empathy for others is considered an developmentally adaptive competency[49] and is fundamental to the development of close relationships,[50] evidence has shown that there can be substantial emotional "costs of caring"[51] that can be mediated by this process of empathetic distress.[48]

This cross-over of stress has been documented among young adolescent friend pairs, with the young women reporting more empathetic distress than boysyoung men.[48] Given evidence that men and women report different patterns in internalizing and externalizing responses to stress,[11,12] it is possible

that young men may report less empathetic distress, but more externalizing coping behaviors (e.g. substance use) as a result of his partner's stressful experiences.

Current study

Many studies have shown that an adolescent's experiences of stress have a negative influence on their own health behaviors(e.g.[19–23,25,30,36]) and at least one study has shown that adolescents' experiences of stress can influence a close friend's emotional distress.[48] There is also a substantial literature focused on the transmission of job-related stress among husbands and wives.[4]

Very little attention has been paid to the consequences of experiences of stress on romantic partners—someone with whom a pregnant adolescent or young adult has an important relationship and interacts frequently. No research to our knowledge has explored paternal experiences of stress during his partner's pregnancy and the effects on his own and his pregnant partner's health behaviors. Further, no studies have explored whether experiences of stress can cross-over and affect a romantic partner's health behaviors among adolescents and young adults who are expecting a baby.

The current study aims to fill these gaps in the literature by examining how both personal and partner experiences of stress are associated with poor health behavior during pregnancy among a sample of expectant adolescent and young adult couples who are largely racial and/or ethnic minorities and have a low socioeconomic status. First, we describe expectant parents' experiences of stress during pregnancy across several domains (e.g. personal hardship, close relationship stressors, neighborhood problems and discrimination). Second, drawing from stress and coping theory, we describe the association of these experiences with ~~their poor~~negative health behaviors and mental health (substance use, unprotected sex, conduct problems and depressive symptoms). Third, we dr~~e~~aw upon stress and strain cross-over theory to explore partner effects—the association between a *partner's* experiences of stress with one's own poor health behaviors and mental health.

b. Method

Participants and Procedures

The current study is a secondary data analysis of baseline data collected between 2007 to 2011 from 296 expectant young couples (females ages 14–21 years and their male partners ages 14+ years) enrolled in a longitudinal study of relationships and health during the transition to parenthood. Detailed study procedures are published elsewhere [52] and within the previous chapter. In short, young women and men in a romantic relationship and expecting a baby were recruited from four urban university affiliated hospital-based clinics in lower Connecticut (CT) (Yale University Women's Center and ultrasound clinic, Bridgeport Hospital OB/GYN clinic, New London OB/GYN clinic, Hospital of St. Raphael OB/GYN clinic). The couples completed separate audio computer-assisted self–interviews (A-CASI), which allows participants with low literacy to complete the survey [53] and elicits more accurate and valid responses to sensitive questions.[54,55] Of the 413 eligible couples screened, 72.2% enrolled. Compared to those who refused to participate, participants were on average two weeks further along in pregnancy at screening ($P < 0.03$). Participants versus those who refused participation did not vary by any other pre-screened demographic characteristic (all $P > 0.05$).

A research assistant obtained informed consent from the couples at the baseline survey. Participation was voluntary, confidential, and did not influence the provision of health care or social services. All procedures were approved by the Yale University Human Investigation Committee and by Institutional Review Boards at study clinics. IRB approval to use the de-identified PARTNRS data was also obtained from the CUNY Graduate Center.

Commented [HJ6]: Describe what characteristics you collected

Commented [HJ7]: Individually or as a couple?

Commented [HJ8]: Before you get to the measures, since this is a longitudinal study, it would help to understand whether you are only analyzing baseline data for both measures of 'stress' and 'health behaviors' i.e. doing this as a cross-sectional analysis or if it has a longitudinal component in which case would help to understand the visit schedule and to clarify in describing the measures at what point in time you are using the data – or maybe this comes later?

Measures

Stressors

Stressful life events related to *close relationships* and *personal hardship* were evaluated by adapting the Life Events Scale [56]. Respondents indicated whether they had experienced 11 stressful life events in the previous 6 months. Four stressful life events, including broke off a steady relationship, a relative suffered a serious illness, injury or assault, a family member or close friend died and had a serious problem with a friend, neighbor, or relative, were grouped and summed as *events related to close relationships*. Seven stressful life events, including having money problems, being unemployed, moving, having something lost or stolen, problems at work or school, problems with the police, and suffered a serious illness, injury or assault, were grouped and summed as *events related to personal hardship*. Higher scores on this measure indicate the respondent experienced more stressful life events.

Respondents' perception of *neighborhood problems* was assessed using a 15-item adapted version of the Perceived Neighborhood Problems Scale [57]. Respondents indicated how much various neighborhood problems were an issue in their neighborhood, on a 3-point scale ranging from 1="not a problem" to 3="serious problem." Sample items from the original scale include "smells and fumes," "assault and muggings," and "vandalism." Two additional items were added to the original 13-item scale: "feeling unsafe after dark" and "drugs." Responses to items were summed to form a total *neighborhood problems* scale ranging from 15 to 45 (α = .95).

Perceived *general discrimination* was assessed using a 20-item adapted version of the Daily Life Experiences Scale, a subscale of the Racism and Life Experiences Scales [58]. Items concerned how often respondents experienced discriminatory treatment, such as not being given service in a store or restaurant, or being stared at by strangers. Responses were indicated on a 6-point scale ranging from 0="Never" to 5="Once a Week or More." A mean score was calculated from the 20 items to form the *general discrimination* score (α = .93).

Health Behavioral Risk

Smoking, drinking, marijuana use and hard drug use were measured using an adapted, 7-item version of the Recreational Drug Use Scale [59]. Frequency of use during the past three months for each substance (alcohol, cigarettes, marijuana, crack, heroin, methamphetamines, and "other hard drugs") was assessed using a 5-point Likert scale, ranging from 0 = "Never" to 4 = "Every Day." The adapted version included the item "other hard drugs" in lieu of the individual items in the original scale of barbituates, ectasy, gammahydroxybutyrate (GHB), hallucinogens and inhalant nitrates. We summed the report of the use of crack, heroin, methamphetamines, and "other hard drugs," to form a total *hard drug use* score (range 0 to 16) due to the low frequencies of these individual items.

Conduct problems were assessed by means of an adapted, 7-item version of the DSM Conduct Problems Scale [60]. Respondents reported the frequency of various conduct problems in the previous 6 months on a 4-point scale ranging from 1= "Not at All" to 4="5 or more times." Sample items included "skipped school or work," "got in a fight," and "stole something." Items were summed to form a total conduct problems score ranging from 7 to 28, with higher scores indicating more conduct problems.

Protected sex was assessed by asking respondents the number of times they had sex with their most recent partner in the past month and, of those, the number of times they used a condom. Percent protected sex was calculated from the ratio of number times they used condoms to number of times they had sex, with respondents not having had sex coded as 100% protected sex.

Mental Health

Depressive symptoms over the past week were measured using 15 of the 20 items in the Center of Epidemiological Studies-Depression Scale (CES-D).[61] Participants responded on a 4-item scale ranging from 0="Less than 1 day" to 3="5-7days". Items included "during the past week I had crying spells" and "during the past week I felt depressed."

Commented [HJ9]: Why 3 months here – when the others seem to be based on 6 months?

Commented [HJ10]: Was it about the partner in the couple or just whomever they last had sex with?

Analysis

I produced descriptive statistics, including frequencies and means, to describe the demographic characteristics, stressors and behavioral risk outcomes among the sample population. Two men were missing data for stressful life events and therefore I excluded two couples from the analysis resulting in a final sample of 294 couples (n = 588). I used paired t-tests and McNemar's tests to compare the demographic characteristics, stressors and behavioral risk outcomes variables between paired men and women.

Commented [HJ11]: Again using a cross-sectional approach?

I used multilevel modeling to explore the relationship between experiences of stressors and the risk outcome. Specifically, I used the Actor-Partner Interdependence Model (APIM), to account for the correlated nature of the data. This model allowed me to assess the influence of both the respondent (actor effect) and their partner (partner effect). An actor effect indicates whether a respondent's score on a predictor variable is associated with their own outcome (e.g. woman's experiences of stressors relates to her own smoking). A partner effect indicates whether a respondent's partner's score on the predictor variable is associated with the respondent's outcome (e.g., male partner's experiences of stressors influences his female partner's smoking). The APIM uses a single analysis to incorporate responses from both members of a couple and treats the members of a couple as nested scores within the same group [62]. A detailed description of APIM analyses using multilevel modeling programs by Kenny, Kashy, & Cook (2006) served as the guide for our analysis plan. Analyses involving hard drug use were restricted to the male data because no females reported hard drug use. To assess whether gender moderated the influence of stressors on all other health behavior outcomes, gender by stressor interaction terms were tested.

Commented [HJ12]: Here it would help to remind the reader of all the outcomes you were interested In, as well as all of the exposures. The results section is rather large – so helps to remind us what you are testing.

All models controlled for age, education, income and race/ethnicity. In addition, analyses controlled for role occupancy (defined in this analysis as whether they worked, went to school or had other children) because people who have greater role occupancy are likely exposed to more stressors.[63].

Commented [HJ13]: From both members of the pair? Possible interactions between the two? Or did you create couple level characteristics – e.g. both partners had at least a HS diploma

c. Results

Demographic characteristics of the participants are displayed in Table IV-1. The young men were generally older, had more personal income, were more likely to be employed, and were less likely to be in school compared to their female partners.

Table IV-1 also shows that young men and women reported similar amounts of stressful life events related to close relationships and stressful life events related to personal hardship (both P>.05). Young men reported more neighborhood problems (xx% vs. xx%, P<.001) and more general discrimination (xx% vs. xx% P=.02) compared to young women. Table IV-2 shows that money problems were the most common life event stressor in the past six months among both men and women. About one third of the respondents also reported moving within the past six months.

Commented [HJ14]: I would think it might be interesting to look at couple level characteristics as well – e.g. age differential of more than 5 years between partners or educational differential, etc?

Commented [HJ15]: Would be helpful to cite the proportions themselves, not just the p-value

Table IV-1. Demographic characteristics, stressors and outcomes from baseline survey?.

Serious problem with friend, neighbor, relative	17.2	16.3	.82

Commented [HJ19]: Is this about the current partner? Should these figures be more closely aligned?

Multilevel Regression Analyses

Table IV-3 shows the results of the multilevel regression models examining the association between the stressors and the outcomes. The results below describe the results of the gender interaction analyses.

Personal Hardship Stressors and Health Behaviors and Mental Health

Among the total sample, in adjusted models greater frequency of personal hardship stressors predicted more smoking (B=.08, SE=.04, t=2.09, p=.04), marijuana use (B=.04, SE=.02, t=1.90, p=.06), conduct problems (B=.45, SE=.11, t=4.26, p<.001) and depressive symptoms (B=0.41, SE=0.22, t=1.87, p=.06) (Table IV-3). Gender interacted with personal hardship stressors when predicting marijuana use (t=1.96, P=.05) and alcohol use (t=1.97, P=.05). Greater frequency of personal hardship stressors was associated with more marijuana use (B=.14, SE=.05, t=2.76, P=.006) and alcohol use (B=.10, SE=.04, t=2.817, P=.005) among young men only. Gender also interacted with *partner's* personal hardship stressors when predicting marijuana use (t=2.66, P=.008) and depressive symptoms(t=-2.11, P=.04). Greater frequency of *partner's* personal hardship stressors was associated with less marijuana use (B=-.13, SE=.05, t=-2.48, P=.014) and more depressive symptoms (B=0.77, SE=.28, t=-2.79, P=.006) among young men only.

Close Relationship Stressors and Health Behaviors

Among the total sample, in adjusted models, greater frequency of close relationship stressors predicted more protected sex (B=2.96, SE=1.32, t=2.25, p=.03). Gender interacted with close relationship stressors when predicting smoking (t=2.096, p=.037) and marijuana use (t=2.92, p=.004). Greater frequency of close relationship stressors predicted more smoking (B=.22, SE=.09, t=2.44, p=.015), marijuana use (B=.30, SE=.08, t=3.58, p=<.001) and hard drug use (B=.34, SE=.09, t=3.81, p<.001) among young men only. Gender also interacted with *partner's* close relationship stressors when

Commented [HJ20]: Again it is hard to interpret these beta coefficients without understanding the scale.

Commented [HJ21]: I would include the beta with 95% CIs only throughouot the results section

Commented [HJ22]: So you tested each outcome separately but adjusting for demographics?

Commented [HJ23]: For all of these analyses – the women are currently pregnant, no? did they report much of these behaviors to begin with?

Commented [HJ24]: Throughout the results section, please make it clear whether these are crude or adjusted models

predicting conduct problems (t=2.1, P=.04). Greater frequency of *partner's* close relationship stressors related to more conduct problems among young women only (B=.58, SE=.20, t=2.88, p=.004).

Neighborhood Problems and Health Behaviors

Among the total sample, greater frequency of neighborhood problems predicted more smoking (B=.02, SE=.01, t=2.94, P=.001) and depressive symptoms (B=.07, SE=.04, t=2.00, P=.047) . Gender interacted with neighborhood problems when predicting smoking (t=2.09, P=.037), alcohol use (t=2.63, P=.009), marijuana use (t=3.30, P=.001) and neighborhood problems (t=2.42, P=0.16). Greater frequency of neighborhood problems predicted more smoking (B=.04, SE=.01, t=3.89, P<.001), alcohol use (B=.02, SE=.007, t=3.035, P=.003) and marijuana use (B=.03, SE=.008, t=3.77, P<.001) among young men only. Greater frequency of neighborhood problems predicted more depressive symptoms (B=.12, SE=.04, t=2.71, P=.007) among young women only. Among the total sample, greater frequency of *partner's* neighborhood problems predicted more protected sex (B=.29, SE=.14, t=2.04, P=.04). Gender interacted with *partner's* neighborhood problems when predicting smoking (t=-2.07, P=.039). Greater p*artner's* neighborhood problems related to less smoking among young men only (B=-.02, SE=.01, t=-2.02, P=.04).

Commented [HJ25]: What was the level of agreement between partners in reports on protected sex? Did you code this as proportion of protected sex acts for the couple? What did you do when the reports were wildly different?

General Discrimination and Health Behaviors

Among the total sample, greater frequency of general discrimination predicted more conduct problems (B=1.17, SE=.16, t=7.35, p<.001) and more depressive symptoms (B=1.41, SE=.33, t=4.27, P<.001). Gender interacted with general discrimination when predicting alcohol use (t=2.63, P=.009) and depressive symptoms (t=-2.54, P=.01). Greater frequency of general discrimination predicted more alcohol use (B=.15, SE=.06, t=2.652, P=.008) and hard drug use (B=.22, SE=.08, t=2.82, P=.01) among young men only. Greater frequency of general discrimination predicted more depressive symptoms among both young men (B=2.68, SE=.56, t=4.81, P<.001) and young women (B=.86, SE=.38, t=2.29,

P=.02) although the ~~coefficients~~ effect was much stronger for men than ~~are much different for men and~~ women.

Table IV-3. Multi-level linear regression models examining relationship between stressors (own and partner's) and behavioral risk and depressive symptoms. All models control for age, education, income, race/ethnicity, parity and employment status.

Commented [HJ26]: Do you think linear regression is appropriate for these outcomes or are some of the outcomes skewed and should be transformed on the natural log scale or consider a Poisson regression?

Commented [HJ27]: Rather than SE how about 95% CIs?

	Partner's		

[a] Examples of how to read this table: Greater frequency of her partner's neighborhood problems related to less unprotected sex among young women only. Greater frequency of one's own close relationship stressors related to less unprotected sex among both men and women.

Commented [HJ28]: Increases? Put the arrows next to these as well?

Commented [HJ29]: In the text you talk about protected sex going up – maybe keep it consistent to make it easier for the reader?

d. Discussion

Our findings demonstrate that one's own experiences of several types of stressors are related to substance use, conduct problems, unprotected sex and depressive symptoms among both expectant women and men. Negative health behaviors common during adolescence and young adulthood predict future patterns of behavior and health outcomes into adulthood. These behaviors carry even more importance among expectant adolescents and young adults because the behaviors have the capacity to also affect the health of their baby.

Commented [HJ30]: Would help if this were a longitudinal analyses to state this – otherwise you are looking at both exposure and outcome from the same timeframe?

Commented [HJ31]: Careful here – not sure it is more important but just rather has implications for the baby as well (really hate how mothers' own health is considered less important than that of her unborn child in general – need to be careful).

The evidence from this study also concurs with the stress and strain cross-over theory, in which stressful experiences in one's own life, cross- over and affect the health and well-being of a close partner[4]. While several studies have demonstrated that maternal stress is associated with poor maternal health behaviors during pregnancy [42,43], this study is the first to show that *paternal* experiences of stress are predictive of maternal health behaviors, including condom use and conduct problems. Previous studies examining the patterns and predictors of maternal health behaviors have largely neglected paternal influences, despite increasing evidence that social relationships influence health behaviors [64].

Personal experiences of stress and one's own health behaviors

This study identified several different domains of stress that significantly predicted behaviors among young men becoming fathers. Notably, greater personal experiences of all sources of stress (relationship stressors, personal hardship stressors, neighborhood problems and discrimination) were associated with more substance use among the young men in this study. While most research has focused on predictors of maternal health behaviors, understanding the predictors of *paternal* health behaviors has important implications not only for his health, but for his pregnant partner's health as well. Men's negative health behaviors, such as smoking, can directly influence maternal health (e.g. by

Commented [HJ32]: Were associated with

increasing her exposure to second hand smoke) and men's health behaviors can influence his partner's health behaviors. For example, studies have shown that women are less like to quit smoking during pregnancy if her partner smokes [65]. Programs and interventions that aim to reduce substance use among young expectant mothers may be more effective if the substance use of *both* parents is addressed.

Previous research has also largely focused on the negative influence of stress on risk behavior. In this study, not all experiences of stress were associated with *more* risk behavior. In fact, some experiences of stress predicted less risk- and more protective behaviors. Among both men and women, one's own experiences of relationship stressors were associated with less unprotected sex. Because the relationship stressor items included breaking off a steady relationship and having a serious problem with a close friend, this finding may indicate that participants with less stable or more conflicted romantic relationships may perceive more risk from their partner and may then use condoms with this partner to protect themselves.

Among the young women in this study, however, significant associations between stress and substance use were sparse. I did find, however, that experiences of personal hardship stressors were associated with more smoking among women. The lack of consistent associations between maternal stress and substance use in this study may be an artifact of the low prevalence of substance use among the women. These results, however, may show that the stressors that affect paternal and maternal substance use during pregnancy may be different. Previous research has shown that different types of stressors predicted smoking among adolescent girls compared to boys [66]. Previous research has shown that young men and women may use different coping mechanisms to deal with stress[15,67] and the evidence from this study may suggest that young expectant men use substance use as a coping strategy for stress more often than young expectant women.

Commented [HJ33]: Or at least reporting of it, as they were pregnant – could be hesitant to report

Partner's experiences of stress and one's own health behaviors

A majority of previous evidence supporting the stress and strain cross-over theory has found negative effects of stress and strain on a partner's well-being [5]. Contrary to this evidence and our hypothesis, all of the significant effects of the young men's partner's stress (i.e. the association between women's stress with her male partner's behaviors) were associated with *less risk* behavior and *more protective* behavior. Young women's personal hardship stressors were significantly associated with less marijuana use among her male partner, and more women's neighborhood problems were significantly associated with less smoking and less unprotected sex among her male partner. This study, however, found that young men's depressive symptoms were directly associated with his partner's personal hardship stressors. This evidence is consistent with the theory of empathetic distress in which one partner takes on the experiences of stress and distressed emotions experiences it as one's own." [48]

These findings suggest that not all experiences of stress necessarily translate into negative effects on a partner. Popular culture may portray young expectant women's partners only as sources of stress or complication; however, the findings from this study suggest that young men who see that their partner is under significant stress, may improve their health behaviors for their partner's benefit and may empathize with their partner's troubles to the point that they take on the distressed emotions as their own. For all of the negative portrayal of young fathers, they can be an important source of support [68] and fathers may have a meaningful influence on the health behaviors of their pregnant partners [69].

Strengths, Limitations and Future Research Directions

This secondary data analysis has several limitations. This study was cross-sectional and therefore experiences of stress and behavioral risk were assessed at the same point in time limiting our ability to infer causation. The timeframes referenced by each question, however, make the direction of

the hypothesized association plausible. The risk behavior items referred only to behaviors in the previous 3 months. Both personal hardship and close relationship stressors referred to experiences within the past six months. While neighborhood problems and general discrimination were more general questions referring to their daily life, these constructs are likely consistent over time.

Also, pregnant women reported few negative health behaviors in this study during pregnancy. Therefore, the association between experiences of stress and behavioral risk among the women in this sample may be spurious; regardless, I was able to identify a few significant relationships between stress and health behaviors among the women.

Despite these limitations, this study is one of the few that includes a direct report from men of their experiences of stress during their partner's pregnancy and its relationship to risk behavior. In addition, this study includes an assessment of stressors from multiple sources and the distinct relationships with behavioral risk outcomes across these predictors for both men and women. This study also assessed the influence of partner's experience of stress on behavioral risk, which very few studies, if any, have done. In addition, this study assessed stress cross-over from both sides of the couple—many studies just focus on cross-over from one member of the couple to the other [5].

In conclusion, this study filled important gaps in the literature on the factors influencing the health behaviors of young couples expecting a baby. The findings demonstrate that experiences of stress across multiple life domains are associated with both maternal *and paternal* health behaviors among young couples during pregnancy. Interventions that address healthy coping mechanisms among this population may help reduce these unhealthy behaviors. Programs and interventions targeting prenatal health behaviors (particularly among adolescents and young adults) overwhelmingly neglect young male partners of the expectant young woman. These findings indicate that stress is associated with young men's health behaviors during this time. These health behaviors have important implications for their health into adulthood and for the health of their child.

This research also revealed that young women's experiences of stress can cross-over and impact the health behaviors of her romantic partner—but, not in the expected negative direction. The more stress a young expectant woman experienced in multiple domains, the less risk behavior her young male partner reported. The male partners of young expectant women can be an important source of support and may have a significant influence on the health of their pregnant partners. It is critical that programs and interventions aimed to improve prenatal health behaviors of young expectant women include romantic partners and address the importance of the influence of this relationship on their own and their baby's health.

Commented [HJ34]: When feasible and desired by the woman – I think this is important to note, as there can be a fine line when the relationship is an abusive one.

Appendix IV-1. Outcome and Confounder descriptions and details

Construct	Measure	Description	Response Scale	Time Points Assessed	Time Frame Referenced	Summary Measure
Outcomes						
Smoking	Recreational Drug Use Scale[59]	Frequency of smoking	5-pt scale ranging from 0 "Never" to 4 "Every Day."	Baseline	Past 3 months	--
Drinking	Recreational Drug Use Scale[59]	Frequency of drinking alcohol	5-pt scale ranging from 0 "Never" to 4 "Every Day."	Baseline	Past 3 months	--
Marijuana Use	Recreational Drug Use Scale[59]	Frequency of smoking marijuana	5-pt scale ranging from 0 "Never" to 4 "Every Day."	Baseline	Past 3 months	--
Hard Drug Use	Recreational Drug Use Scale[59]	Frequency of use of crack, heroin, methamphetamines, and "other hard drugs"	5-pt scale ranging from 0 "Never" to 4 "Every Day."	Baseline	Past 3 months	Items were summed to form a total *hard drug use* score (range: 0 to 16)
Unprotected Sex	Developed for PARTNRS	Asked respondents t# of times had sex with most recent partner and, of those, the # of times they used a condom.	--	Baseline	Past 1 month	% protected sex was calculated from the ratio of number times they used condoms to number of times they had sex, with respondents not having had sex coded as 100% protected sex.
Conduct Problems	DSM Conduct Problems Scale[60]	Assessed whether participant engaged in conduct problems such as got in a fight or skipped school or work.	4-point scale ranging from 1= "5 or more times" to 4= "Not at all."	Baseline	Past 6 months	7 items were summed to form a total score with higher scores indicating fewer problems (range: 7-28)

Construct	Measure	Description	Response Scale	Time Points Assessed	Time Frame Referenced	Summary Measure
Depressive Symptoms	Center of Epidemiological Studies-Depression Scale (CES-D).[51] (adapted)	15 items assessed how often experienced the depressive feeling or thought (e.g. I felt depressed, had crying spells) -Five behavioral manifestations of depression items were removed	4-point scale ranging from 0 ("Rarely or none of the time (less than 1 day") to 3 ("Most of the time (5-7 days)")	Base (24-40 weeks pregnant)*	Past Week	-Responses summed to form a continuous scale -Higher scores correspond to more depressive symptoms (range: 0-45) (α = 0.84, α = 0.78 m)
Confounders (Maternal and Paternal)						
Age	--	Summary variable created by from birth date.	--	Baseline	Current	Continuous
Personal Income	--	Asked: " What is your personal income (the total income before taxes earned by you only per year)	0 $0-$4,999 1 $5,000-$9,999 2 $10,000-$14,999 3 $15,000-$19,999 4 $20,000-$24,999 5 $25,000-$34,999 6 $35,000-$49,999 7 $50,000 or more	Baseline	Current	Categorical
Employed	--	Asked: "Are you currently employed?"	1 Not working 2 Working Part-time 3 Working Full-time	Baseline	Current	Categorical
In School	--	A summary measure created to indicate if the participant is either in school and/or working at least part-time.	1 Yes 0 No	Baseline	Current	Dichotomous
Years School	--	Greatest number of years of education completed	Values of 1-12 indicate years of primary or secondary school education completed. If marked "Some college", they	Baseline	Current	1-20

Construct	Measure	Description	Response Scale	Time Points Assessed	Time Frame Referenced	Summary Measure
			were given a value of 14. If marked that they "Graduated college" they were give a value of 16. If marked "Some graduate or professional school" they were give a value of 18. If marked "Completed graduate or professional school" they were given a value of 20.			
Race/Ethnicity	--	Variable constructed from two questions, the first asking their race (select all) and the second asking if they are Hispanic or Latino. Coded as black if selected black (regardless of ethnicity), Hispanic if selected Hispanic or Latino (regardless of race), white if they selected white only. All other participants were grouped into the "Other" category due to low sample size.	1= White 2= Black 3= Hispanic 4= Other	Baseline	Current	Categorical
Confounders (Maternal Only)						
Parity (First Child)	--	Assessed # of biological children the respondent had	--	Baseline	Current	A dichotomous variable was created indicating whether the index child was their first child or not 0=No 1=Yes

Appendix III-2. Variable details, items, validity and reliability

Stressful Life Events

This 11-item scale was adopted from the 12-item Life Events Scale, which was created by Brugha and Cragg (1990).[49] This scale asks participants if they have had stressful life events. 10-items out of the original 12-items were incorporated into the questionnaire, however, three original items were revised: "You became unemployed or you were seeking work unsuccessfully for more than one month" was changed to "In the past 6 months, did you become unemployed or were seeking work unsuccessfully," "You had a major financial crisis" was changed to simply "In the past 6 months, did you have money problems," and "You had problems with the police and a court appearance" was changed to "In the past 6 months, did you have problems with the police." Additionally, two questions were combined and changed into one question: "Your parent, child or spouse died" and "A close family friend or another relative (aunt, cousin, grandparent) died" were combined and shortened into "In the past 6 months, did a close family member or friend die."

Additionally 2-items were added for the research study including: "In the past 6 months, did you have problems at work or school," and "In the past 6 months have you moved." Two of the original items from the LEQ were also omitted from the research study including: "You had a separation due to marital difficulties" and "You were sacked from your job."

The test-retest reliability of the Life Events Scale is reported as .84 for a three-month period and .66 for a six-month period. Data on internal consistency are not available. Concurrent validity estimates were derived from the concordance between inpatient psychotic patients' identification of stressful events and those identified by a significant other; there was a 90% agreement when assessed at a three-month period and a 70% agreement when assessed at six months. The authors also used an extensive interview of stressful events as a base rate and showed that the LEQ was sensitive to the identification of stressful events.[49]

Two subscales were created for use in this study: **personal hardship stressors** and **close relationship stressors**. The items in each subscale are listed below.

Items:

In the past 6 months:

Personal hardship stressors

have you suffered a serious illness, injury, or assault?
did you become unemployed or were seeking work unsuccessfully?
did you have money problems?
did you have problems with the police?
did you have problems at work or school?
was something you valued was lost or stolen?
have you moved?

Close relationship stressors

did a close relative suffered a serious illness, injury, or assault?
did a close family member or friend die?
you break off a steady relationship?
did you have a serious problem with a close friend, neighbor, or relative?

General Discrimination

An adapted version of the Daily Life Experiences Scale was used to assess participant experiences of discrimination.[50] The original Daily Life Experiences Scale has 20-items, however the adapted version used 19 of those items. The items how often the survey taker has experienced discrimination (e.g. Being observed or followed in public places). The response scale ranged from 0 to 5: 0= "never," 1= "less than once a year," 2= "a few times a year," 3= "about once a month," 4= "a few times a month," and 5 = "once a week or more." Responses to items were summed to form a total score ranging from 0-95.

Four items from the original scale were also revised, including "Being mistaken for someone else of your same race (who may not look like you at all)" was changed to "mistaken for someone else (who may not look like you at all)" and "Being asked to speak for or represent your entire racial/ethnic group (e.g. What do ___people think?)" was changed to "asked to speak for or represent an entire group (e.g. What do ___people think?), "Overhearing or being told an offensive joke or comment" was changed to "hear an offensive joke or comment" and "Being avoided, others moving away from you physically" was changed to "avoided, or do others move away from you physically." There was also one item added: "Someone in the health system showed you hostility or a lack of respect, refused you service or paid less attention to you compared with others" and one item was omitted "Being considered fascinating or exotic by others."

Items

In general, how often are you ignored, overlooked, or not given service (in a restaurant, store, etc.)?
In general, how often are you treated rudely or disrespectfully?
In general, how often are you accused of something or treated suspiciously?
In general, how often are you do others react to you as if they were afraid or intimidated?
In general, how often are you observed or followed while in public places?
In general, how often are you treated as if you were "stupid", being "talked down to"?
In general, how often are your ideas or opinions minimized, ignored, or devalued?
In general, how often do you hear an offensive joke or comment?
In general, how often are you insulted, called a name, or harassed?
In general, how often do others expect your work to be inferior?
In general, how often are you not taken seriously?
In general, how often are you left out of conversations or activities?
In general, how often are you treated in an "overly" friendly or superficial way?
In general, how often are you avoided, or do others move away from you physically?
In general, how often are you mistaken for someone who serves others (i.e., janitor, bed boy, maid)?
In general, how often are you stared at by strangers?
In general, how often are you laughed at, made fun of, or taunted?
In general, how often are mistaken for someone else (who may not look like you at all)?
In general, how often are you asked to speak for or represent an entire group (e.g., "What do _____ people think?")?
In general, how often has someone in the health system showed you hostility or a lack of respect, refused you service or paid less attention to you compared with others?

Neighborhood Problems

This 15-item scale was adapted from the 13-item Perceived Neighborhood Problems Scale[57] in order to assess the participant's perception of their neighborhood's quality. Two items were added to the original scale: "Feeling unsafe after dark" and "drugs." Participants are asked to respond using the scale: 1 = "Not a problem," 2 = "Minor Problem," and 3 = "Serious Problem."

The 15 items were summed to form a total score.

Items

In your neighborhood, how much of a problem is….

- Vandalism
- Litter and rubbish
- Assault and muggings
- Disturbance by children or youngsters
- Speeding traffic
- Nuisance from dogs
- Reputation of neighborhood
- Smells and fumes
- Burglaries
- Discarded needles and syringes
- Uneven or dangerous pavements
- Lack of safe places for children to play
- Lack of recreational facilities
- Feeling unsafe after dark
- Drugs

Conduct Problems

Conduct problems were assessed by means of an adapted, 7-item version of the DSM Conduct Problems Scale.[60] Participants indicated how often they had various conduct problems in the previous 6 months on a 4-point scale ranging from 1= "5 or more times" to 4= "Not at all." The original DSM Conduct Problems Scale included 17 items and was based on the criteria for a DSM-III-R conduct disorder. The internal consistency of the items in the original scale among a sample of gay/bisexual youth was .74.[60] The 7 items were summed to form a total score.

Items

Please mark how often you have done the following in the last 6 months.

Skipped school or work?
Yelled at a friend or family member?
Got into an argument with others?
Got in a fight.
Said things that weren't true?
Stole something?
Been in trouble at school or work?

Depressive Symptoms

Fifteen items were adapted from the 20-item Center for Epidemiologic Studies Depression Scale (CES-D), which was developed by Radloff (1977).[51] The items address whether the participant felt or exhibited the behavior of the major components of depression in the previous week (e.g. I felt that everything I did was an effort). As the original CES-D scale specified, participants were asked to respond using: 0= "rarely or none of the time (less than 1 day)," 1= "some or a little of the time (1-2 days)," 2 = "Occasionally or a moderate amount of the time (3-4 days)," and "Most or all of the time (5-7 days)." The five behavioral manifestations of depression items were removed, including item did not feel like eating, trouble keeping mind on what I was doing, everything I did was an effort, my sleep was restless, and could not get going.

The CES-D scale discriminates strongly between patient and general population groups, be sensitive to levels of severity of depressive symptomatology, and reflect improvements after psychiatric treatment. In addition, it should correlate well with other scales designed to measure depression, and be related to a felt need for psychiatric services.[51]

The CES-D scale has been found to have high internal consistency (coefficient alpha =.85 in the general population and .90 in the patient sample); studies found that both inter-item and item-scale correlation were higher in the patient sample than in the population samples. The scale also has moderate test-retest reliability (r between .45 and .70). Test-retest correlation was higher for shorter time intervals.[51]

Items

During the past week…

I was bothered by things that usually don't bother me.
I felt I could not shake off the blues even with help from my family or friends.
I felt that I was just as good as other people.r
I felt depressed.
I felt hopeful about the future. r
I thought my life had been a failure.
I felt fearful.
I was happy. r
I talked less than usual.
I felt lonely.
People were unfriendly.
I enjoyed life. r
I had crying spells.
I felt sad.
I felt that people disliked me.

r=reverse coded

Dissertation Abstract

Title: The Impact of Climate Variability and Conflict on Childhood Diarrhea and Malnutrition in West Africa

Author:

Sponsor: Deborah Balk

Objectives: This dissertation aims to contribute to our understanding of how climate variability and armed conflict impacts diarrheal disease and malnutrition among young children in West Africa. Two studies examine the associations between climate and diarrheal disease across the whole study area – ten countries in West Africa during the period 2008-2013. The third study examines diarrheal disease and malnutrition in Northeast Nigeria before (2008) and after (2013) the start of the current armed conflict in the area.

Methods: Outcome variables and child, caregiver, and household characteristics for these studies are from the Demographic and Health Surveys. Additional datasets include specialized products for rainfall, temperature, climate class, population density, and urban population ranking. The first two studies use geospatial techniques to 1) determine if there are areas of elevated risk after controlling for climatic and other covariates and 2) determine whether there is spatial variation in the associations between diarrheal disease and climatic and other covariates. The third study uses a double-difference methodology to study both diarrheal disease and malnutrition and their associations with conflict.

Results: The first study found statistically significant clusters of elevated risk in 10 urban areas and 13 largely rural areas after adjusting for household and climatic factors with a relative risk range of 1.5 to 7.2. Results from the second study indicate that the associations between diarrheal disease and key household, environmental, and climatic factors vary according to location – a phenomenon which is masked by global

models - and that the associations are both positive and negative (increase and decrease risk). The third study found that if children exposed to the conflict in Northeast Nigeria had not been exposed, their mean weightfor-height z-scores would be nearly half a standard deviation higher, the proportion of moderately and severely wasted children would be 13 percentage points lower, and the prevalence of diarrhea would be 8 percentage points lower than they are.

Conclusions: The studies in this dissertation provide additional evidence for the relationships between climate variability, conflict, and child health in West Africa. Previous studies have provided mixed evidence for the role of factors such as rainfall on child health outcomes. Here, geo-spatial methods identify both areas of heightened risk and the role of specific risk factors in particular locations. For example, the first study found elevated risk of diarrheal disease in northern Cameroon and the second study indicates that two risk factors in that area are low coverage of improved sanitation facilities and low rainfall at the time of the survey. The effects of conflict on child health are conceptually inherent and have been quantified with different methods and outcomes. The research here furthers those efforts by quantifying the impact of a particular conflict – the Boko Haram insurgency - on the health and growth of young children.

The findings from this research support on-going development goals which aim to improve modifiable factors including increased coverage of improved water sources and sanitation facilities, increased educational attainment, the alleviation of poverty and food insecurity, and resolving on-going conflicts around the world. The results also support adaptation measures, which are aimed at factors that are difficult to change in themselves, such as living in areas where temperatures are increasing due to climate change. Such measures include promoting income diversification and access to goods and services for farmers and pastoralists and

improving infrastructure and public services in urban areas. Limitations, including spatial, temporal, and methodological issues with the data sources are discussed, as are suggestions for future research.

Acknowledgements

I would like to express my deep appreciation and gratitude to my committee members - Deborah Balk (Sponsor), Glen Johnson (Chair), Grace Sembajwe (First Reader), and Emmanuel d'Harcourt (Outside Reader) – for their guidance, thought-provoking suggestions, and general collegiality throughout the doctoral experience. I would also like to thank the faculty, staff, and my fellow students at CUNY from whom I learned so much. And most of all, a heartfelt thank you to my extended family and friends near and far who have encouraged and supported me over these past years.

Chapter 1. Introduction

This dissertation is concerned with two aspects of environmental health – climate variability and conflict – and their impact on children in the developing world. The outcomes studied are diarrheal disease and malnutrition. The population of interest is children under five years old in West Africa (Figure 1.1). This subregion was chosen because of its compelling burden of disease, variation both socially and climatically, and on-going challenges such poverty and armed conflicts:

- Population health has improved greatly in sub-Saharan Africa, yet in 2013, the region contributed 50% of global child deaths.[1] Forty-two percent of those deaths were in the sub-region of West Africa.[2] The causes in West Africa were primarily infectious diseases such as diarrhea, pneumonia, and malaria; neonatal disorders; and nutritional deficiencies.[3]
- The nations of West Africa have many cultural, economic, and political linkages, yet are on distinct development paths with some countries steadily improving over recent years (Senegal, Benin), others worsening (Mali), and some staying relatively steady but with poor standing in world rankings of key indicators (Guinea, Cote d'Ivoire).[4]
- The majority of people in West Africa are still quite exposed to the natural environment with rudimentary physical barriers (e.g., adequate shelter) and policy barriers (e.g., water quality standards).
- West Africa has a varied climate, from the humid coast with up to 10 meters of rainfall to the arid desert with months of no rainfall at all.[5] Temperatures range from an average monthly low of 23□C to an average monthly high of 33□C.[6]

- With its direct effects on health and as an obstacle to development, armed conflict is a major public health issue in Africa.[2] In 2014, there were 9 armed conflicts in sub-Saharan Africa and two of those were in West Africa (Nigeria and Mali) with several other areas of lower intensity unrest.[7]
- Sub-national survey data on child health and key covariates were available for several countries in West Africa within a reasonable timeframe from the Demographic and Health Surveys.[8]

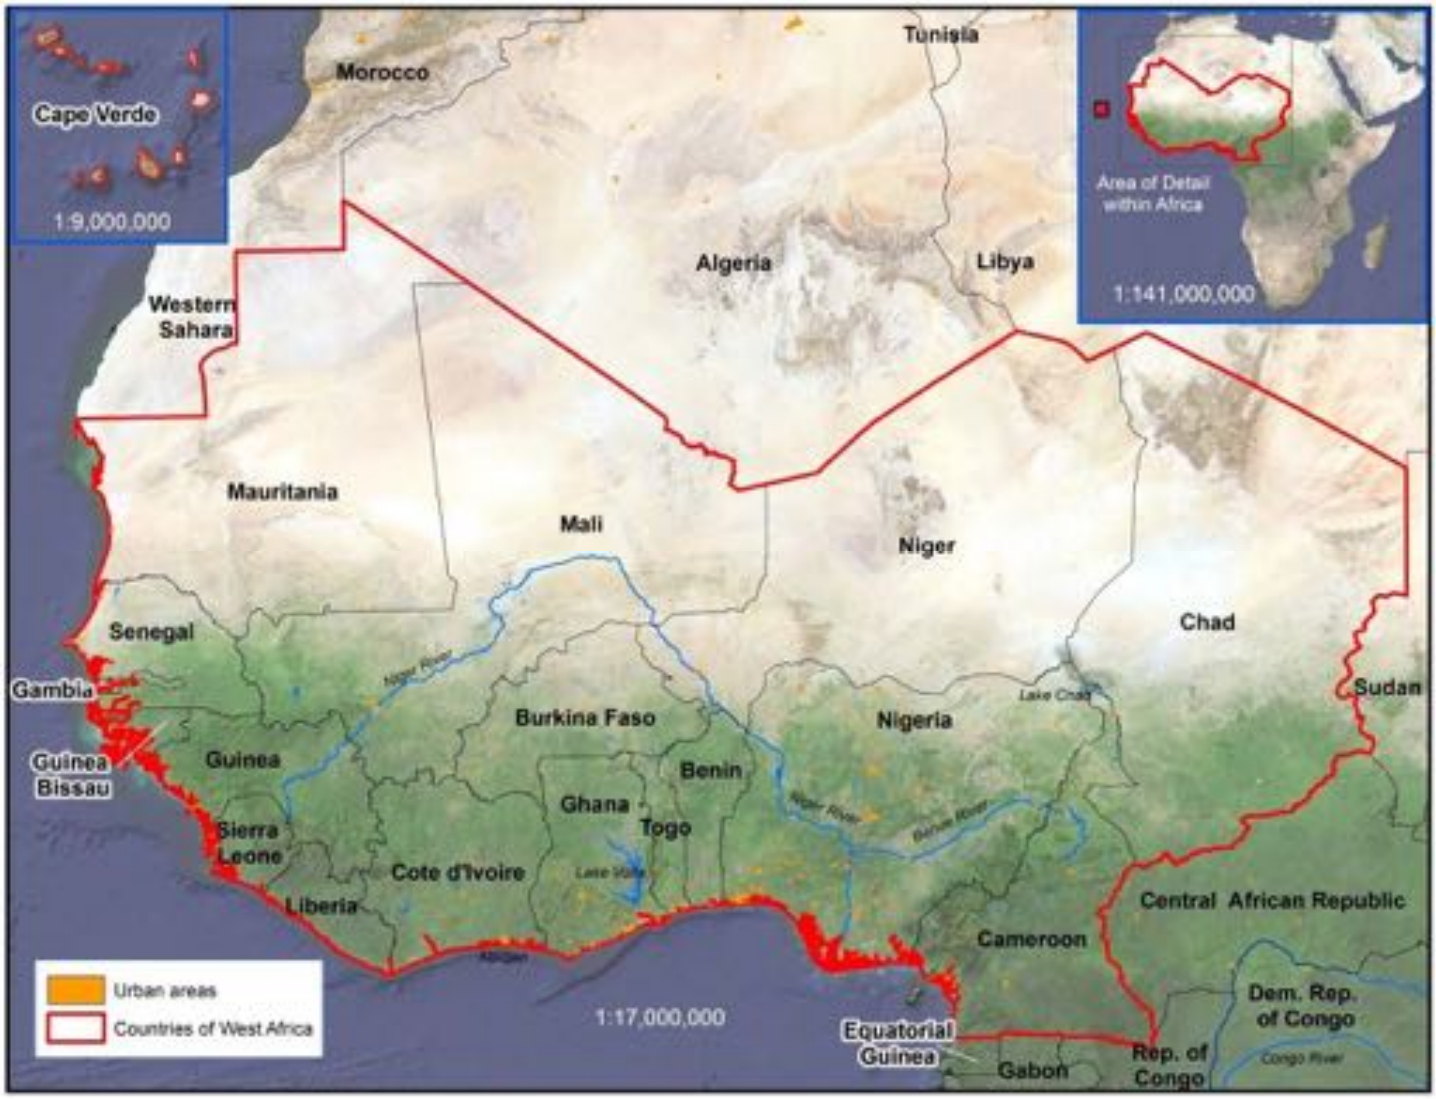

Figure 1.1: Countries of West Africa, using the definition from the Organisation for Economic Co-operation and Development (OECD): the 15 members of the Economic Community of West African States (ECOWAS) plus the three bordering countries of Mauritania, Chad, and Cameroon.[9] Cape Verde is an island nation 500 km west of Senegal. The Sahel is the southern edge of the Sahara Desert, seen in this composite satellite image as the transition from green vegetation to tan sands.

1.1 Childhood diarrhea and malnutrition

Diarrhea is a leading infectious cause of death in children under five years old worldwide.[1] Although mortality attributable to diarrhea has decreased significantly over the past 15 years, morbidity has changed little.[10] In 2013, 578,000 children died from diarrhea (uncertainty range 448,000 – 750,000).[1] Fifty-four percent of those deaths were in sub-Saharan Africa and 25% of those were in Nigeria.[11] There are approximately 1.7 billion global cases of childhood diarrhea every year.[12,13]

Malnutrition is also a leading cause of illness and death in children in the developing world.[14] Nutritional deficiency is the primary cause of death in 6.7% of deaths in children between 28 and 364 days and 7.2% of deaths in children between 12 and 59 months (136,000 and 142,000 deaths, respectively, in 2010).[15] However, malnutrition is more important as an underlying condition which contributes to child mortality.[14] It is indicated in about 45% of all child deaths worldwide and in 60% of child deaths attributed to diarrheal disease.[16,17] Globally in 2014, about 50 million children were wasted (thin for their height due to acute malnutrition) and 159 million were stunted (short for their age due to chronic malnutrition).[18] Approximately 28% of wasted children and 37% of stunted children live in Africa.[18] The West Africa sub-region has one of the highest burdens of malnutrition; in 2014, 9% of the children were wasted (the public health emergency threshold is 10%).[18]

Infectious diarrhea is caused by a variety of bacteria, viruses, protozoa, and helminthic organisms.[17] These pathogens - which are transmitted largely through the ingestion of contaminated fecal matter - cause an infection of the intestinal tract which disrupts normal gut functioning.[17] Severe cases of diarrhea can lead to extreme dehydration and death.[19] This makes children under five years old particularly vulnerable to the disease because - relative to older children and adults – their immune systems are not as developed, water

makes up a larger proportion of their bodyweight, they ingest more water because of their higher metabolic rates, and their kidneys are not able to conserve as much water.[19]

In the direct sense, malnutrition (or more accurately for this dissertation, undernutrition) is caused by a lack of food quantity and/or nutritional content which leads to growth failure and/or micronutrient deficiencies.[20] However, as with diarrheal disease, the underlying causes are more complex. Poverty, which plays a central role, is influenced by factors such as the socio-political context and the natural environment.[21] In turn, poverty can lead to food insecurity, unhealthy environments such as a lack of adequate sanitation, and limited access to quality health care, all of which result in illness and death among children.[21]

A child with repeated diarrheal episodes may experience a deficit of caloric intake and micronutrients due to intestinal malabsorption.[17] This can result in rapid weight loss and increased vulnerability to infection due to the breakdown of mucosal barriers.[17] At the same time, the child is growing weaker and his immune system may become compromised, making him more vulnerable to diarrheal and other infections.[17] Thus, diarrhea and malnutrition have a bi-directional association with one causing the other and forming a vicious cycle that can lead to severe illness and death. Since this cycle is most common at ages critical to physical growth and brain development, longer-term consequences may include stunting; impaired intellectual development and school performance; decreased economic productivity and reproductive performance; and increased risk of metabolic and cardiovascular disease.[21,22]

Figure 1.2 is a conceptual framework showing the relationships among diarrhea, malnutrition, and their underlying causes.

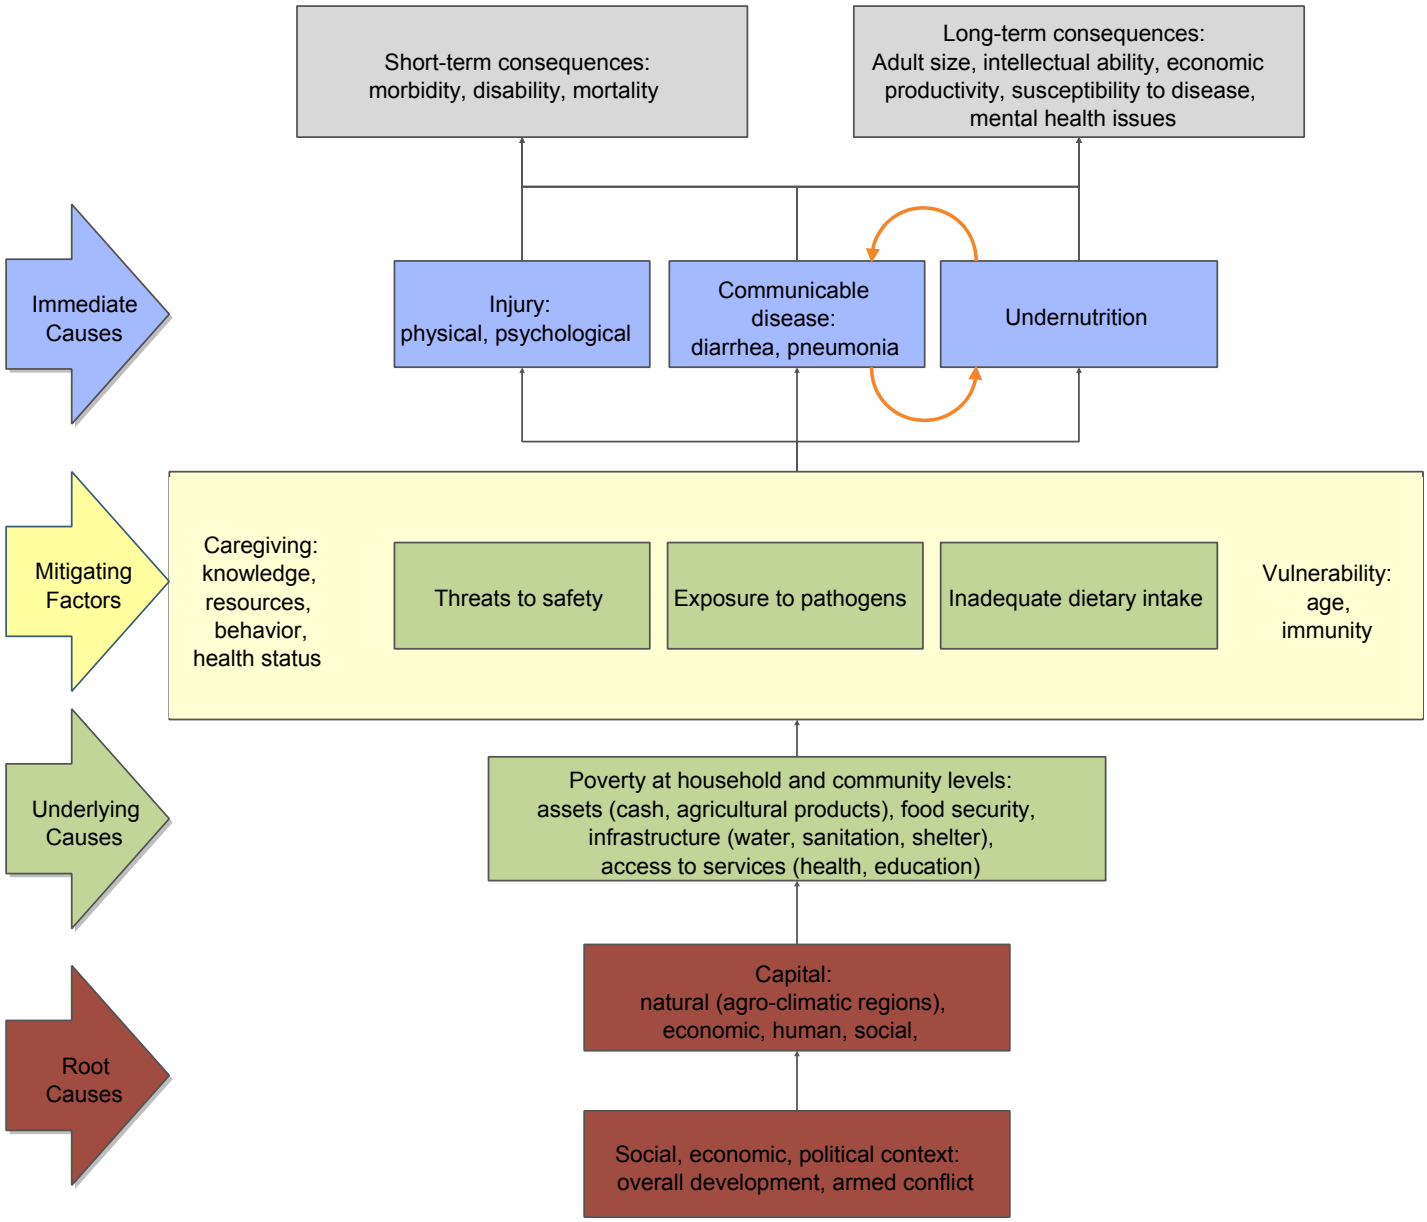

Figure 1.2: Framework of the relationships among root, underlying, and immediate causes of communicable diseases such as infectious diarrhea; undernutrition; and injuries (other non-communicable diseases are not shown). Mitigating factors influence whether and how underlying causes affect a child and whether the immediate causes are lessened or avoided. Orange arrows depict the cyclical nature of recurring infections and malnutrition. Based on frameworks from Black et al (2008), World Health Organization (2010), and Guha-Sapir & van Panhuis (2002).[21,23,24]

Preventative and therapeutic measures to combat diarrhea and malnutrition morbidity and mortality are also linked. Breastfeeding is protective because it provides adequate and complete nutrition for young children, helps build their immune systems, and reduces their exposure to unsafe water and food.[25,26] Even after weaning, appropriate child feeding, including complementary and supplementary foods as needed, is also key

to development and health.[27] Zinc supplementation as a therapeutic and preventative measure curtails the severity and duration of diarrheal episodes, helps protect against future episodes, and also increases growth and weight gain in young children.[17,27] Other supplementation such as Vitamin A for children and folic acid for pregnant women is also necessary in high-risk populations. Some of the most important preventative measures against infectious diarrhea are those that improve hygiene practices, sanitation systems, and safe water consumption.[28] A comprehensive review of these interventions found reductions in diarrhea incidence of 48%, 36% and 17% associated with handwashing with soap, contained excreta disposal, and improved water quality, respectively.[29] While still not widely accessible in resource-poor settings, vaccines against some enteric pathogens such as rotavirus and cholera have shown to be effective.[30]

1.2 Climate variability and health

Climate variability is the change in factors such as precipitation and temperature over a timescale of months, seasons, and years.[31] There are two parts to the measurement of climate variability – average and range.[31] Averages are usually taken over a thirty-year period for a given area which smooths any fluctuations.[31] Range – highs, lows, and extreme events – show deviations from the trend line.[31]

In West Africa, climate variability is dominated by the dry and wet seasons which result from the migration of two air masses (Figure 1.3).[32] The first air mass is hot and dry and blows from the Sahara southwards from November to February, reaching between latitudes 5° and 7°N (the southern coast of West Africa) in January.[32] The second air mass creates southwest winds which carry moist air from the ocean inland, reaching between latitudes 18° and 21°N (northern Mali, for example) in July.[32]

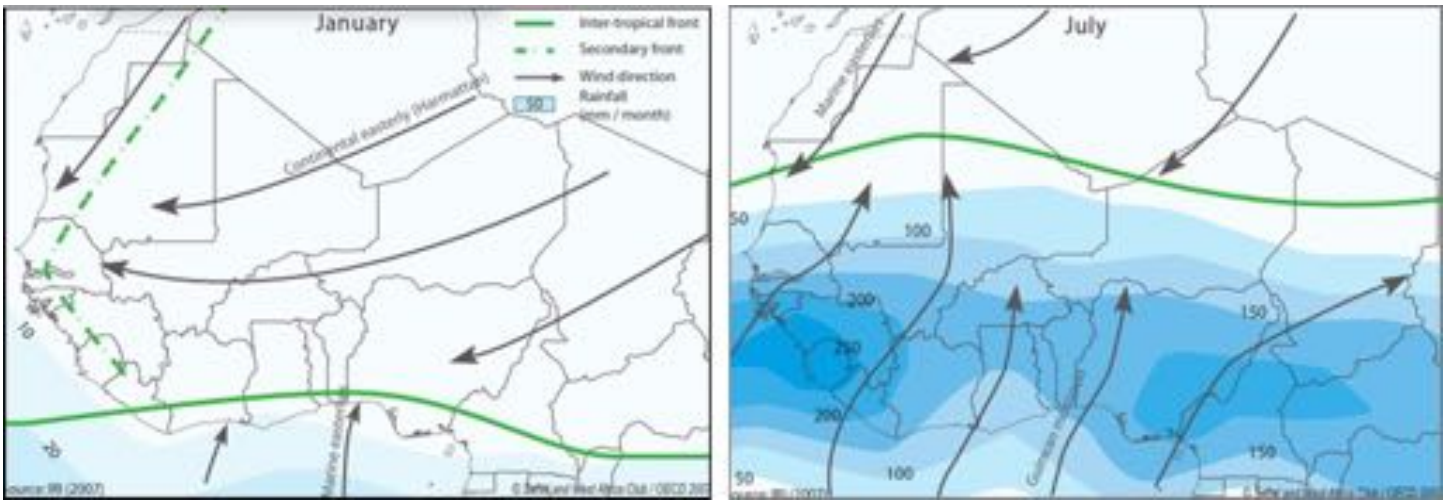

Figure 1.3: Graphic of seasonal climate variability in West Africa with the height of the dry season in January (left) and the wet season in July (right). From Jalloh et al (2011).[32]

Local air temperature is determined not only by latitude, but by elevation, land coverage, distance from the coast, and wind strength and direction among other factors. In West Africa, the influence of latitude and distance from coast is evident on a country-level scale: higher latitude (more desertic) countries and those that are land-locked (e.g., Burkina Faso) have overall higher temperatures than those closer to the equator, which are coincidentally coastal. Furthermore, the range of temperatures is greater throughout the year for higher latitude/landlocked countries, whereas equatorial countries stay within a narrower range of temperatures (about 15°C as opposed to 22°C).[6]

Seasonal and interannual climate fluctuations have direct consequences on human health, especially among poor, agriculture-dependent populations at low latitudes where climate-sensitive health outcomes such as diarrheal disease, malnutrition, and malaria are prevalent.[33] Since these diseases affect children the most, the overall disease burden due to climate (and climate change) is borne by children in developing countries.[34]

Climatic factors such as temperature, rainfall, relative humidity, and air pressure directly influence the presence of diarrheal pathogens in the local environment.[35] These factors are in turn regulated by seasonal

changes so that, for example, bacterial loads in food and water may increase in warmer periods, viruses flourish in cooler periods, and protozoa are more common in wet and warm conditions.[36] A few studies have quantified the relationship between diarrhea, climate variables, and seasonality. The most relevant of these are from sites with similar climate types as those found in West Africa. In Lima, Peru (the same climate type as the Sahara), Checkley (2000) found that hospital admissions for children with diarrhea increased by 8% for every 1□C from the previous mean temperature.[37] During an El Niño year when temperatures were up to 5°C above normal, diarrheal hospitalization rates among children increased to 200% the previous rate.[37] A study in Taiwan - parts of which have the same climate type as the south coast of West Africa – found that extreme rainfall events (>350 mm/day) were associated with a 6-fold increase in the relative risk of reported enterovirus infection and a nearly 8-fold increase for bacillary dysentery compared with normal (<130 mm/day) events.[38] A meta-analysis of childhood rotavirus infection in India, Pakistan, Bangladesh, Nepal, and Bhutan – which include the four climate types found in West Africa – found that a 1□C decrease in monthly ambient temperature was associated with a 1.3% increase from the annual rate of rotavirus infection.[39] Additionally, a decrease of 10mm in precipitation was associated with a 0.3% increase of infection.[39] In several settings, diarrhea transmission has been found to increase during normal rainy seasons due to fecal contamination of water sources.[40] However – perhaps particularly in areas that are overall more arid – diarrhea incidence may be higher in the dry season due to food insecurity and increased transmission by flies, which touch down on feces and transmit pathogens to food, surfaces such as in the food preparation area, or directly into the mouth of a child.[21,41,42]

Most of the world's food insecure and undernourished populations are in sub-Saharan Africa and South Asia.[43] Again, the causes are bi-directional, but these regions are largely rural, poor, and dependent on rain-fed

agriculture.[44] Large areas of these regions have low agricultural productivity in part due to climatic risks – not only extremes such as droughts and floods, but also more minor fluctuations such as a late rainy season.[44]

1.3 Armed conflict and health

In the post-Cold War period, many West African nations have been affected by various forms of conflict from civil wars (Liberia, Sierra Leone, Côte d'Ivoire, Guinea-Bissau), to coups d'état (Guinea, Côte d'Ivoire, Mali, Gambia, Niger) to ethnic and religious clashes (Nigeria, Mali, Benin).[45] While there is no one unifying theory as to the causes of conflict in Africa, weak governance seems to be a common factor.[46] Fragile states often cannot establish and maintain democratic systems, support economic development, control threats to security, and ensure the equitable sharing of natural resources.[46] While poverty in itself is not necessarily a driving force (many poor countries have been at peace for decades), inequality often is.[46] Similarly, ethnic or religious diversity is not often a root cause, but marginalization and disillusionment with the government can lead people to identify more with a particular group than with the state or larger society.[46]

Conflict affects child health through multiple pathways both directly and indirectly. Community and household resources may be diminished as funds are diverted away from social services (such as immunization programs), prices for food and other commodities rise, and fear or physical obstacles (checkpoints, landmines) prevent caregivers from pursuing the family's livelihood activities (such as accessing fields and livestock grazing lands).[47,48] Infrastructure such as health facilities, markets, water supply and sewage systems, schools and roads may be damaged or otherwise inaccessible.[47,48] Supply chains for food imports and essential medicines are often disrupted.[47,48] Populations may be forced to leave a conflict zone which could expose them to inadequate shelter, water, sanitation, and food and deprive them of livelihoods.[47,48] Displacement puts additional stress on host populations and their services and could increase population density.[48] Skilled healthcare and other personnel may leave the area and the most vulnerable households may be unable to do

so.[48]

Most deaths due to conflict, particularly for children, are not from direct causes such as war-related trauma, but are due to the conditions that were already the main causes of death before the conflict including diarrheal disease, acute respiratory infections, measles, malaria, and severe malnutrition.[49] Therefore conflict seems to both exacerbate pre-existing health issues and introduce new ones.[49,50]

The effects of war on child health are often studied through household surveys either in real time or retrospectively. In one of a series of mortality surveys in the Democratic Republic of Congo, a strong association between conflict and both violent and non-violent deaths was found.[51] In conflict and non-conflict areas of the country, the main reported causes of death were fever and malaria, diarrheal disease, and respiratory infections.[51] Children are most vulnerable to these diseases and those under five had nearly four times the risk of dying than people five and older.[51] Malnutrition was reported as an underlying or primary cause of death in 10.9% of deaths in conflict areas and 8.1% in non-conflict areas.[51] In Burundi, the civil war of the 1990s was marked by displacement, looting of household assets (including livestock), and the theft or burning of crops.[52] Using a spatiotemporal conflict exposure variable, researchers found that rural children who had been exposed to war for more than 14.7 months (the average exposure time) had height-for-age zscores 0.67 standard deviations lower than unexposed children ($p < 0.01$). Additionally, for every month of exposure, height-for-age z-scores decreased by 0.05 standard deviations.[52] A study in Angola found higher levels of malnutrition (wasting and stunting) in conflict-affected areas and among assumed supporters of the opposition (determined by ethnolinguistic group), even after controlling for urban-rural and other demographic differences.[50]

Although beyond the scope of this dissertation, whether there are linkages between climate variability and conflict is a question that has gained attention recently because a more variable climate is predicted for several regions - including sub-Saharan Africa - due to climate change.[53] There are several theories for how the two are linked: 1) extremes such as drought or flooding cause a scarcity of resources which lead to violent disputes, 2) economic shocks due to climate extremes facilitate the recruitment of insurgents as subsistence economies falter, and 3) climate variability increases the economic divide within societies, exacerbating grievances to the point of violence.[53] There are some case studies which seem to support these theories (for example, disputes over watering holes in Ethiopia grew violent during the drought of 2002); however, there is little evidence at this time to support the overall hypothesis that climate variability causes violent conflict.[53]

1.4 Overall goal of dissertation

Evidence for significant associations between climate variability and child health outcomes is compelling, but lacking for West Africa where the direction (or bi-directionality) and magnitude of associations is largely unknown, as are specific areas of elevated risk. Also lacking is quantitative analysis on the impact of the one of the world's newest conflicts, the Boko Haram insurgency, which currently affects several West African nations. The goal of this dissertation is to address these gaps and contribute to our understanding of how climate variability and conflict impacts diarrheal disease and malnutrition among young children. Two aims examine the associations between climate and diarrheal disease across the whole study area – ten countries in West Africa from 2008 to 2013. Both studies use geo-spatial techniques to 1) determine areas of elevated risk after controlling for climatic and other covariates and 2) determine whether there is spatial variation in the associations between diarrheal disease and climatic and other covariates. The third aim takes a closer look at one particular area – Northeast Nigeria - where high rates of diarrhea were noted in the first two studies and where there is an on-going armed conflict. Diarrhea and malnutrition outcomes are studied using a double-difference methodology.

1.5 Specific aims and hypotheses

Specific Aim 1: To describe the geo-spatial distribution of childhood diarrheal disease across West Africa during the period 2008-2013 with respect to household and climatic characteristics, including identifying any statistically significant clusters of elevated risk.

Hypotheses: Unadjusted prevalence rates will vary across the region and within countries and areas of particularly high or low rates may be seen. However, without adjusting for seasonality (climate class, rainfall, temperature) and household variables (wealth, mother's education, child's age, etc.), it will be difficult to make any conclusions about areas of elevated risk. In adjusting for these factors, household variables will be similar to the associations seen in the literature (e.g., elevated risk with increased poverty, *ceteris paribus*). Diarrhea risk is expected to increase as climate classes go from the wetter south to drier north. Associations between rainfall and diarrhea will show that both extremes (too dry, too wet) will increase the risk of diarrhea. The relationship between temperature and diarrhea will be weaker than for rainfall, and will show increased risk with increased temperature. Cluster analysis will detect specific areas of elevated risk, even after controlling for household and climatic variables. These clusters will be more dominant in rural areas, but certain urban areas may also show heightened risk.

Specific Aim 2: To examine whether there are any significant spatial variations in the relationship between childhood diarrhea and key socio-economic, climatic, and environmental characteristics across West Africa in the period 2008-2013.

Hypotheses: In the global model, risk of diarrheal disease will increase with increases in percent of households with unimproved water sources and toilet types and percent of mothers with no formal education. Risk will also increase with higher latitudes (more arid climate types), temperatures, and population densities (overall urban disadvantage) and will decreases with higher rainfall. In geographically weighted models, climate class/latitude, altitude, and population density will have spatially stationary associations with diarrheal disease (i.e., their effect will be the same across the study area). Rainfall and temperature will show spatially non-stationary associations (for example, rainfall – and the lack thereof - will have a larger effect in dry areas than in areas of moderate precipitation). Associations between diarrhea and percent of population with unimproved water sources and toilet types and percent of mothers with no formal education will be spatially stationary within countries, but spatially non-stationary between countries (for example, the percent of mothers with no formal education will have the same effect on childhood diarrhea wherever they live within a country, but because of different development levels, the association will change from country to country). Associations for socio-economic factors such as education will be positive (e.g., higher percentages of households with unimproved toilets will correlate with higher risk of diarrheal disease). Other factors such as rainfall and population density will show both negative and positive associations (e.g., urban advantage and urban disadvantage).

Specific Aim 3: To examine the associations between the recent conflict in Northeast Nigeria and the prevalence of childhood malnutrition and diarrheal disease.

Hypotheses: Malnutrition and diarrhea rates will be similar in conflict areas and non-conflict areas before the start of the insurgency with a generally improving trend over time, but rates will increase in conflict areas after the start of the insurgency while maintaining a general downward trajectory in non-conflict areas. An

estimation of the counterfactual – the average outcome for conflict-affected children if they had not been affected - will show improvements through increased z-scores (closer to the healthy average) and reduced rates of moderate/severe malnutrition and diarrhea. Weight-for-height and diarrhea prevalence will show the largest effect because these outcomes are sensitive to acute emergencies, while the effects for height-for-age and weight-for-age will not be as evident.

Chapter 2. The Geo-spatial Distribution of Childhood Diarrheal Disease in West Africa: A CovariateAdjusted Cluster Analysis

Abstract

This research describes the geo-spatial distribution of childhood diarrhea in ten countries of West Africa during the period 2008-2013. Logistic regression with household and climatic explanatory covariates was used to obtain predicted diarrhea cases, which were compared to observed cases in a cluster analysis. The regression analysis showed increased and statistically significant odds of diarrhea among children age 12-23 months in poorer and larger households, and where mothers had little education. Overall, children in urban areas had overall higher risk than children in rural areas. Odds of diarrhea increased with latitude from the wetter coastal areas to the drier northern areas. There was a positive linear association between temperature and the odds of diarrhea and an apparent u–shaped association between rainfall and diarrhea, with the lowest odds where there was moderate precipitation. Covariate-adjusted cluster analysis detected statistically significant clusters in ten major cities (e.g., Dakar, Senegal; Yaoundé, Cameroon) and in 13 largely rural areas (e.g., southern Mali). Areas with particularly high relative risk included a small village in south-central Nigeria (6.03), Cotonou, Benin (7.16), and Kaduna, Nigeria (7.21). The study demonstrates the continued importance of development programs (poverty reduction, education) and adaptation measures (food security in a warming Sahel region) to protect child health, and that these interventions should be tailored to meet the needs of specific populations (e.g., sewage systems in certain urban areas).

2.1 Introduction

Of the 6.3 million deaths in children under five years old in 2013, nine percent (567,000) were attributed to infectious diarrhea.[1] Although rates have declined significantly over the past 15 years, diarrhea remains the second leading cause (after pneumonia) of mortality in children in the post-neonate period.[1] In 2010, there were an estimated 1.7 billion cases of childhood diarrhea worldwide.[2] A quarter of these – 437.6 million

episodes – occurred in Africa.[2] In high-burden countries such as Mali, Nigeria, and Burkina Faso, incidence is particularly elevated (3.96, 3.89, and 3.51 episodes per child-year, respectively, compared to the global average of 2.7).[2,3] There is evidence that prevalence varies considerably within countries, yet many countries have a single national strategy to address diarrhea. For example in Nigeria's national health strategy 20102015, there is acknowledgement that children living in the north of the country have higher mortality rates than their southern counterparts, yet there is no mention of specific regional targeting of interventions such as rotavirus immunization.[4]

Diarrhea is a leading cause of malnutrition in young children and together, these conditions form a vicious cycle of decreased energy intake, loss of micronutrients, and increased vulnerability to infection.[5,6] Diarrheal episodes and potential bouts of malnutrition occur at ages critical to physical growth and brain development.[7] As a result, in addition to short-term outcomes (illness, disability, death), there may be longer-term consequences such as stunting; impaired intellectual development and school performance; decreased economic productivity and reproductive performance; and increased risk of metabolic and cardiovascular disease.[8]

There are several known risk factors for childhood diarrhea. Since the most common transmission of diarrheal pathogens is through the fecal-oral route, a majority of cases occur in poor households and areas – both rural and urban - where there is limited opportunity for personal hygiene, inadequate sanitation facilities, limited access to safe drinking water, threats to safe food preparation (such as the presence of flies), and restricted access to quality healthcare.[7,9] Maternal educational attainment is also associated with higher risk, perhaps because the mother is frequently the child's primary - and often only - source of healthcare.[10,11] In low- and middle-income countries worldwide, diarrhea incidence is highest in children aged 6-11 months and then decreases with age.[12]

Less well-understood are risk factors for diarrhea associated with climatic conditions such as temperature and rainfall, which directly influence the presence of diarrheal pathogens in the local environment.[13] For example, bacterial loads in food and water may increase in warmer periods, viruses flourish in cooler periods, and protozoa are more common in wet and warm conditions.[14] Under hot, dry conditions, pathogens can become more concentrated in water sources as evaporation increases, thereby increasing the risk of disease.[15,16] Diarrhea incidence may be higher in the dry season due to food insecurity, reduced hygiene, and increased fly activity.[8,17-19] However, diarrhea transmission has also been found to increase during the rainy season due to fecal contamination of water sources.[20]

Despite progress in understanding the risk factors associated with childhood diarrhea and generally where the burden is highest, few studies have shown how the risk is associated with both household and climatic variables and where specific clusters of risk are located within West Africa, including within countries.

The aim of this study is to describe the geo-spatial distribution of childhood diarrheal disease across West Africa during the period 2008-2013 with respect to household and climatic characteristics, including identifying any statistically significant clusters of elevated risk. West Africa was selected as the study site as the region has a high burden of childhood disease and accounts for the more than 40% of child deaths in subSaharan Africa.[21] West Africa also has a varied climate, which helps to illustrate the role of different types of climatic exposures. The availability of sub-national data within a reasonable timeframe was also a consideration. These factors led to the final ten countries studied: Benin, Burkina Faso, Cameroon, Côte d'Ivoire, Ghana, Guinea, Mali, Nigeria, Senegal, and Sierra Leone (Figure 2.1).

It is hypothesized that unadjusted prevalence rates will vary across the region and within countries and that areas of particularly high or low rates may be seen. However, without adjusting for seasonality (climate class, rainfall, temperature) and household variables (wealth, mother's education, child's age, etc.), it will be difficult to make any conclusions about areas of elevated risk. In adjusting for these factors, household variables will be similar to the associations seen in the literature (elevated risk with increased poverty, *ceteris paribus*). Diarrhea risk is expected to increase as climate classes go from the wetter south to drier north, which is an overall harsher climate with regards to food security, remoteness, and access to health care. Associations between rainfall and diarrhea will show that both extremes (too dry, too wet) will increase the risk of diarrhea. The relationship between temperature and diarrhea will be weaker than for rainfall because allcause diarrhea will mask the presence of different pathogens, each with a preferred temperature range. Cluster analysis will detect specific areas of elevated risk, even after controlling for household and climatic variables because of community-level factors not included in the analysis. These clusters will be more dominant in rural areas as is the global finding, but certain urban areas may also show heightened risk.

Figure 2.1: Map of the ten West African countries that make up the study area. The northern part of Mali was not included in the data source.

2.2 Methods

Data

This study combines health and climate data from a variety of sources. The outcome of interest – diarrhea episodes among children under five – as well as key household covariates are from the Demographic and Health Surveys (DHS).[22] Urban/rural designations and climate data are derived from specialized products described below.

Demographic and Health Surveys are large, nationally representative household surveys which have been conducted in low- and middle-income countries since 1984.[22] Among the many topics covered are those related to child health; not only specific diseases, but also underlying influences such as household wealth and

the vaccination status of the child. Because the surveys use similar sampling methods and questionnaires, they are considered comparable across countries and time periods.[22]

The DHS uses a two-stage sampling methodology. The country is first stratified by geographic (usually administrative) regions crossed with urban or rural designation.[23] In each stratum, enumeration areas determined by the most recent census are used.[23] In the first stage, a number of primary sampling units are selected from the enumeration areas in each stratum. The household lists in these areas are updated, and a fixed number of households are selected.[23] All household members within a specific group (relevant here is all women age 15-49) in the selected households are chosen for the survey.[23] Those women with children age 0-59 months are asked about the health and care of their children.[23]

Most DHS surveys are now geocoded.[22] A GPS coordinate is recorded at the approximate center of each primary sampling unit.[24] To ensure confidentiality, these sampling point coordinates are then randomly displaced 0-5 kilometers in rural areas and 0-2 kilometers in urban areas.[24] Sampling point coordinates are sometimes not collected or cannot be verified and are listed as missing.[22]

Note that the northern part of Mali was not surveyed in the 2013 DHS and is not included in this analysis (Figure 2.1).

Diarrheal disease

The outcome of interest is whether the child has had diarrhea in the past 2 weeks. Interviewers are trained to explain this means three or more loose or liquid stools per day.[25]

Wealth Index

Rather than using an income-based measure of wealth, which can be difficult to assess in low- and middleincome countries, the DHS uses a Wealth Index developed with the World Bank.[26] The Index is based on assets and services available to the household and contains variables directly and indirectly associated with childhood diarrhea. These variables include the source of drinking water, type of toilet facility, type of flooring, presence of electricity, and the ownership of agricultural land, a refrigerator, and a television or radio (which may be linked to health messaging). Social measures such as education are purposely not included in the Wealth Index.[26] The Index is presented in terms of quintiles based on the population distribution from poorest quintile to wealthiest quintile.

Household size

This is the number of people who usually live and eat together, whether they are related or not, plus any visitors who spent the night before the interview with the household.[25]

Educational attainment of mother

Educational attainment is the highest level attended, but not necessarily finished. Although different countries have different educational systems, this variable has been standardized to include no formal education, primary education, secondary education, and higher than secondary education.[25]

Age of child

The age of the child is measured in months. Here, age has been categorized according to known vulnerabilities and behaviors of children under five such as the introduction of solid food around 6 months and increased mobility around 1 year.[12]

Urban/Rural class

Urban/rural classification was derived from the Global Rural-Urban Mapping Project (GRUMP).[27] Urban extents are based on a combination of known settlement points, population counts, and the presence of nighttime lights.[27] While DHS also distinguishes between urban and rural areas, GRUMP is likely more consistent on a regional level.

GRUMP is available as a gridded dataset. For categorical rasters such as GRUMP, DHS recommends using a 5km buffer around each sampling point to reduce bias introduced by the confidentiality offset.[24] This guidance along with the high resolution (1 km) of the dataset provided the opportunity to create a third class: urban observations are where the 5-km buffer is completely within an urban extent; rural observations are completely outside urban extents, and peri-urban is where the 5-km buffer encompasses both urban and rural areas.

Climate class

The Köppen-Geiger climate classification scheme (KGCC) was used to assign each child a particular climate regime. The KGCC is built on three elements – main climate type (equatorial, arid, etc.), precipitation regime, and as relevant, temperature characteristics.[28] For the West Africa study area, there are five climate types as shown in Figure 2.2.

The KGCC dataset is available on a 0.5x0.5 degree grid.[29] For this categorical raster, if the 5-km buffer around the sampling point intersected two climate classes, the class with the majority of area was used. Because there were only 15 observations in the Fully Humid class, the Monsoonal and Fully Humid classes were combined for analysis.

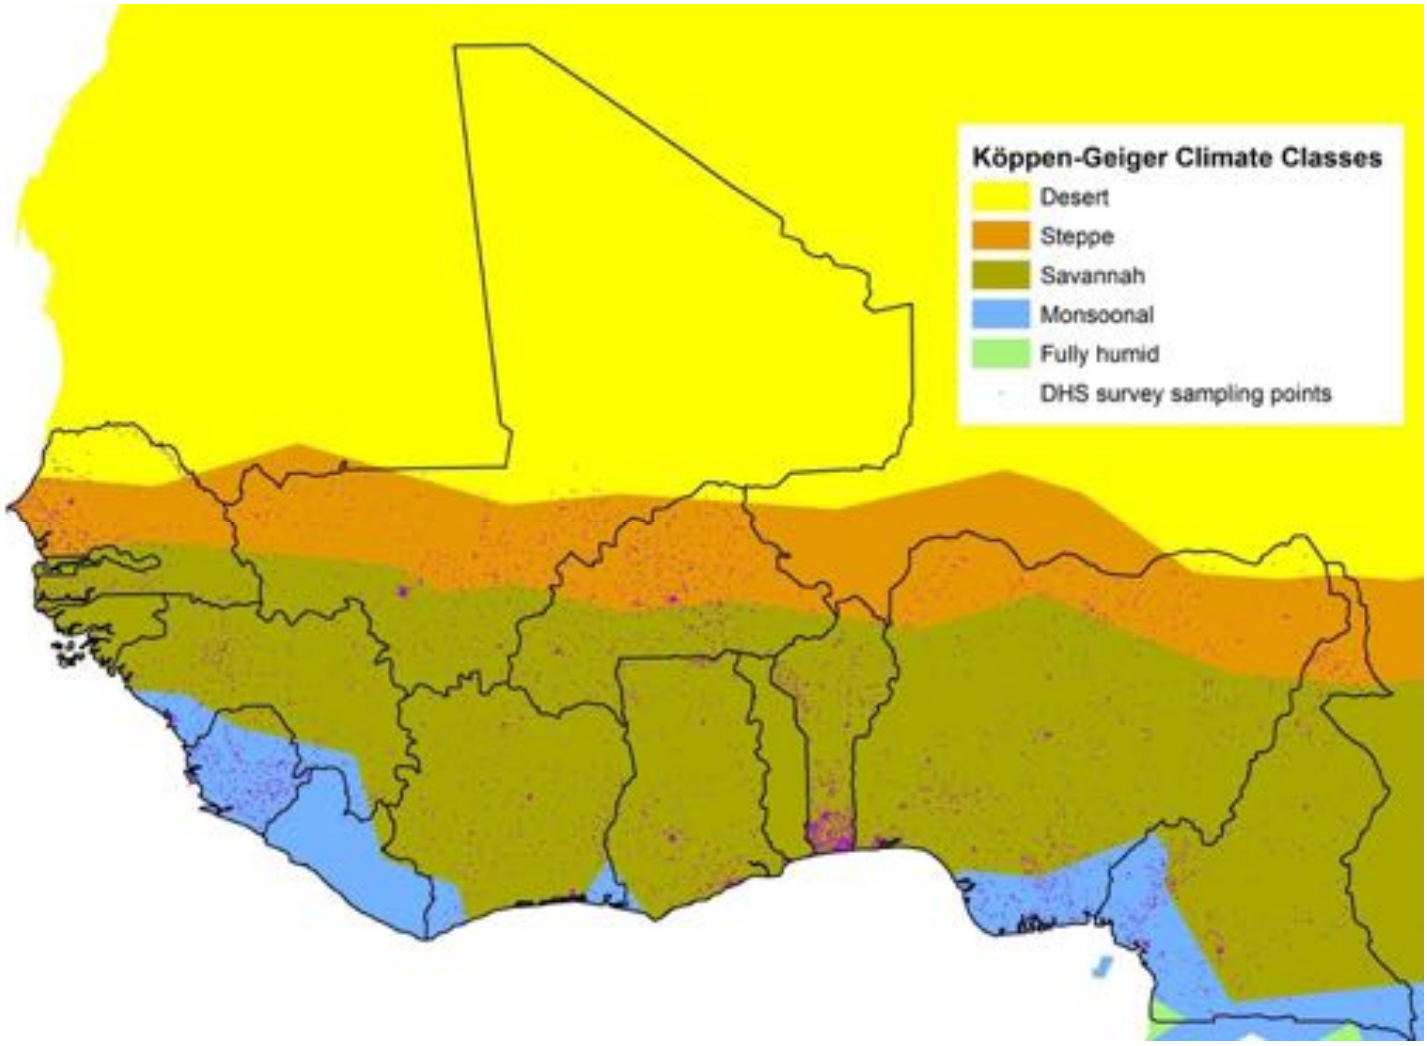

Figure 2.2: Köppen-Geiger climate classes for West Africa with locations of DHS sampling points. Names of climate classes have been abbreviated; full definitions are shown in Appendix 2.1.

Temperature

Temperature data was obtained from the Climatic Research Unit (CRU) time-series (TS) dataset version 3.22.[30] CRU TS v. 3.22 is a global dataset containing several climate variables derived from weather stations.[30] For this study, monthly mean temperature in the month of the interview was used. The data are calculated on 0.5x0.5 degree grids.[30]

For continuous rasters such as this, DHS recommends either point extraction or – for consistency with categorical rasters – a 5-km buffer.[24] Because the temperature rasters are considerably coarser than 5 km, point extraction was used.

Rainfall

Rainfall data are from TAMSAT (*T*ropical *A*pplications of *M*eteorology using *SAT*ellite data and ground-based observations) which is a product specifically for Africa.[31] Here, 10-day (dekad) estimates are used; specifically the average rainfall during the four dekads before and of the interview. TAMSAT is a high resolution (4 km) continuous raster dataset; therefore, the average rainfall within the 5-km buffer around each sampling point was used.

Analyses

Data preparation

Sample weights were normalized from the country level to the level of the study area and applied to the DHS data (calculations are shown in Appendix 2.2). These regional level weighted values are used throughout the analysis.

Voronoi polygons were generated with ArcGIS software version 10.2 from the sampling points to create a surface which aids with the visualization of patterns across the study area.[32] Each polygon defines an area of influence around its unique sampling point so that any location within the polygon is closer to that point than any other sampling point.[33]

General distribution of diarrhea prevalence

The number of children with diarrhea per number of children surveyed were mapped by Voronoi polygon to illustrate the general distribution pattern.

Covariate-adjusted cluster detection and evaluation

Statistically significant spatial clusters of diarrheal disease were detected in the study area through a spatial scan statistic, as encoded in SaTScan software version 9.4.1.[34,35] This method evaluates many possible clusters, each centered on a particular polygon and varying in size depending on the number of contiguous polygons. For each potential cluster with risk that is elevated relative to everywhere in the study area outside of the cluster, the null hypothesis is tested whereby the elevated cluster is assumed to have occurred from random chance alone. Clusters with elevated risk were identified if there was no more than a 5% chance of incorrectly rejecting the null hypothesis that the elevated risk was just from random variation ($p \leq 0.05$).

A purely spatial discrete Poisson model is used. This modeling compares the observed cases (weighted diarrhea cases aggregated to each sampling point) to the expected cases. To calculate the expected cases, logistic regression was applied at the individual level to obtain covariate-adjusted predicted values, which were then aggregated to each sampling point.

For the regression, the SAS SurveyLogistic procedure was used.[36] This incorporates the sample design into the data analysis.[36] Here, the sample strata are sub-national regions, clusters are DHS sampling points, and weight is regional weight.

Three models were developed for computing the expected number of diarrhea cases based on different sets of explanatory covariables. Model 1 provides predicted values based on household characteristics. These include household wealth and size, mother's educational attainment, the age of the child, and urban/periurban/rural designation. Model 2 is based on climatic factors including climate class, average temperature in the month of the interview, and average rainfall in the 4 dekads before and of the interview. Model 3 incorporates all the household and climatic variables.

In running the three models, the maximum cluster size was designated as up to 50% of the population at risk (the maximum), p-values were based on 999 iterations (results were the same for 9,999 iterations), and there was no geographic overlap among clusters. All the clusters with a p-value of ≤ 0.05 were mapped in ArcGIS by Voronoi polygon.

2.3 Results

The ten DHS surveys used in this study are shown in Table 2.1. Out of a total of 117,374 weighted observations, 1,563 (1.3%) were not geocoded as required for this study and were not included in further analysis. The geocoded and non-geocoded data have virtually identical diarrhea prevalence rates (p-value for two-tail t-test = 0.89). In the Burkina Faso and Sierra Leone surveys, respectively, two sampling points were coincident and therefore the data were combined, resulting in a total of 4,944 sampling points used in the analysis.

No.	Country	Survey Dates	No. of Geocoded Sampling Points	No. Mothers Interviewed	No. Children Under 5
1	**Benin**	Dec 2011 - Mar 2012	746	8,897	13,043
2	**Burkina Faso**	May 2010 - Jan 2011	543	10,042	14,698
3	**Cameroon**	Jan 2011 - Aug 2011	577	7,727	11,872

Table 2.1: List of ten DHS surveys used in this study with dates, number of sampling points, mothers interviewed, and children under five years old (mothers and children weighted).

Table 2.2 provides descriptive characteristics of the study population at the individual level. Any missing values are randomly distributed and no sampling point had only missing values. The mean age of the children was 29 months. Households had an average of 8 people, ranging from an average of 6 in Ghana to 14 in Senegal. The overall prevalence of diarrhea in the population was 12.8%, with the lowest rates in Benin (6.0%) and the highest in Senegal (19.6%) and Cameroon (19.1%). In rural areas, 83.8% of the population under 5 was in the lowest three wealth quintiles, while it was 35.3% in peri-urban areas, and 7.0% in urban areas. Among the mothers, 62.9% had no formal schooling; 73.2% in rural areas, 47.9% in peri-urban areas, and 31.2% in urban areas. The average number of children under 5 per mother was 1.5.

Fifty-eight percent of this population lives in the savannah climate class, while only 2% live in the true desert. Average temperature in the month of interview was normally distributed with a mean of 27.8□C. Rainfall was heavily right-skewed with more than half the children experiencing ≤ 10 mm of precipitation in the 4 dekads before and of the interview. As a group, however, these surveys do not exhibit significant "dry season bias", which can occur if fieldwork is scheduled to avoid the rainy season because travel is often difficult.[37] For these surveys, it is estimated that of 54% of fieldwork months were in the dry season against a backdrop of 48% of months of dry season overall.

At the aggregate level, in 5.4% of sampling points (Voronoi polygons), 80% or more of households are in the bottom wealth quintile, while in 44% of sampling points, 80% or more of households are in the bottom *three* wealth quintiles. In 36.7% of polygons, 80% or more of mothers have no formal education while in 59.9% of polygons, 25% or more of mothers have some education (primary, secondary, or higher). 57.4% of polygons are designated as rural, 35.1% as peri-urban, and 7.5% as urban. 16.2% of polygons are in the fully humid/monsoonal climate class, 63.9% are savannah, 18.5% steppe, and 1.6% desert.

Table 2.2: Characteristics of the study population at the individual level.

The overall distribution of diarrhea prevalence by Voronoi polygon is shown in Figure 2.3. Higher and lower prevalence of diarrhea are evident, both across the region and within countries. In the country with the lowest overall prevalence, Benin, 90% of the polygons have prevalence of 15% or lower, while only 10% of the polygons have prevalence rates between 15.1% and 60%. In Senegal, which has the highest overall

prevalence, the distribution is more even: 30% of polygons have prevalence rates up to 10%; 34% of polygons have rates between 10.1% and 20%, and 36% of polygons have rates between 20.1% and 58%. Nigeria provides an example of within country variation: in the North East Zone (outlined in blue), the average diarrhea prevalence is 17.8% (SD 11.1%) while in the rest of the country, rates are considerably lower with an average of 6.9% (SD 1.4%).

The prevalence of diarrhea over the entire study area is 12.8%; however, the rate in 38% of the polygons is higher than that with up to three-quarters of children afflicted. In contrast, there were no diarrhea cases in 23% of the polygons.

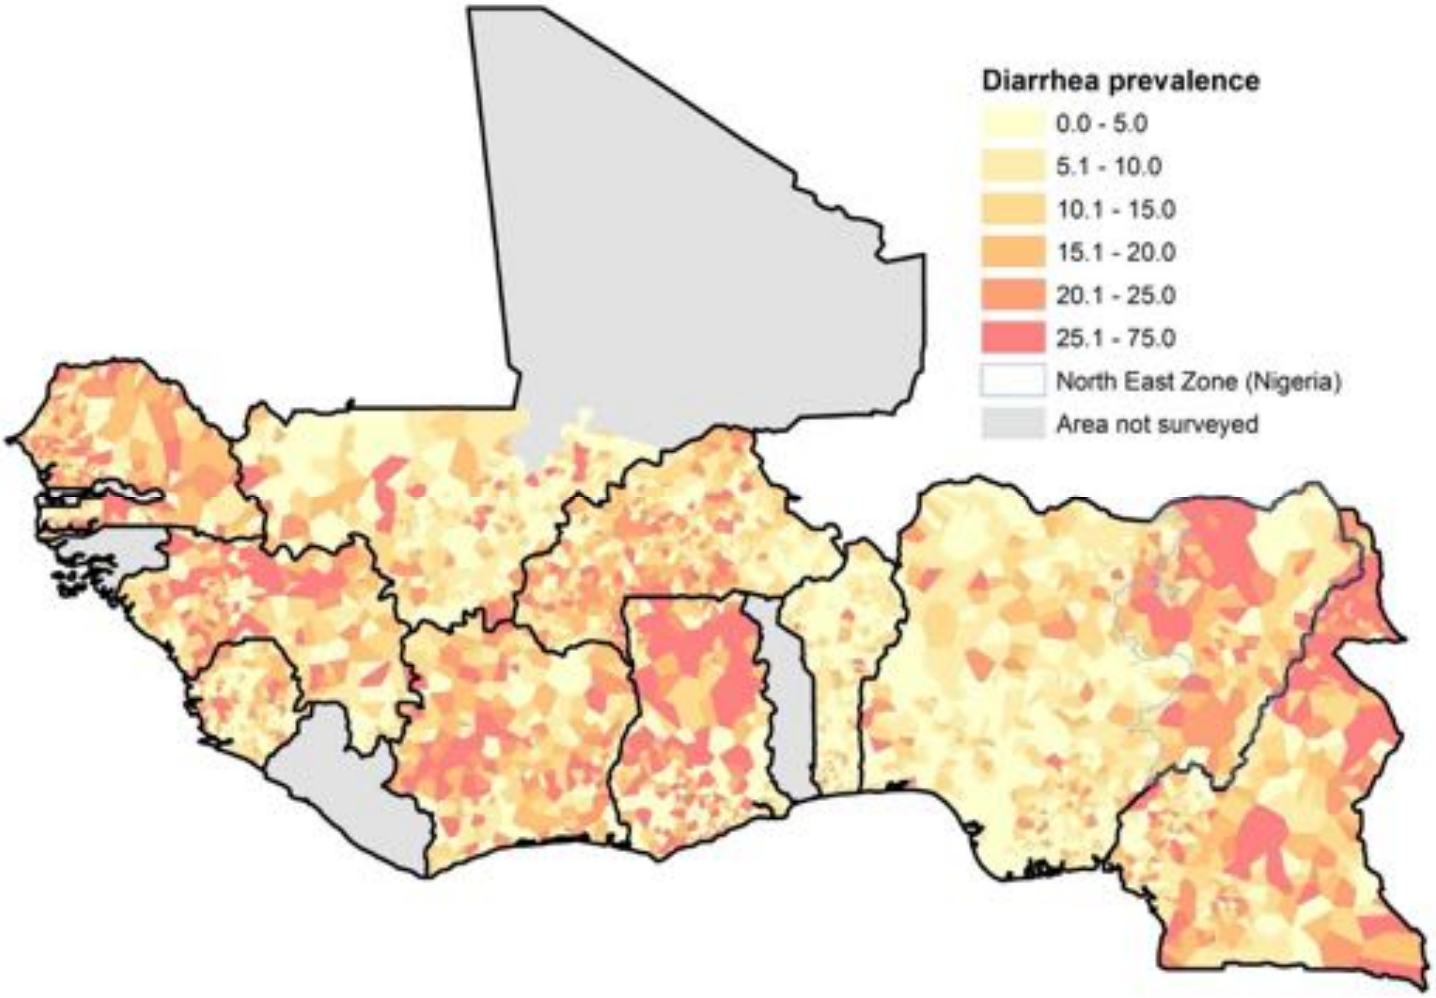

Figure 2.3: Unadjusted diarrhea prevalence by Voronoi polygons around sampling points (points not shown). The North East Zone of Nigeria is outlines as an example of intra-country variation.

The odds ratios, 95% confidence intervals, and percent concordance for the three logistic regression models used for computing expected values for the cluster analysis are shown in Table 2.3. There is a weak to moderate effect on diarrhea prevalence for all of the explanatory variables. All values except one rainfall category are statistically significant at the alpha = 0.05 level.

In Model 1 (household covariates), *ceteris paribus*, household wealth shows a dose-response association such that the odds of a diarrheal episode for children in the poorest quintile is 58% higher than for those in the wealthiest quintile. Increasing household size also steadily increases the odds of diarrhea: the odds of diarrhea for a child in a very large household are 95% higher than for those in a small-to-average-size

household. Children with mothers who had at least some primary education have the highest odds of diarrhea – over twice the odds than for children with mothers with a post-secondary education. Compared to children 24-59 months, children age 12-23 months have over twice the odds of a diarrheal episode while babies age 05 months have 14% reduced odds. The odds of diarrhea for children in urban areas are 72% higher than in rural areas and 18% higher than in peri-urban areas.

In Model 2 (climatic covariates), the odds of diarrhea increase as the general environment goes from wet to arid such that the odds in a desert setting are 80% higher than in a fully humid/monsoonal area. Increasing temperatures also increase the odds – compared to slightly cooler average temperatures, hotter temperatures increase the odds by 22%. Compared to virtually no rainfall, increased rainfall reduces the odds of diarrhea by 18%; however at still higher levels the odds of diarrhea increase again (by 13%).

In Model 3, combining all the variables does not substantially change the odds ratios for the household variables, indicating that they are independent from the climatic variables. The odds ratios for climate classes are consistently lowered (though still positive and significant), showing slight confounding from the household variables. Temperature and rainfall also act independently.

Percent concordance for Model 1, Model 2 and Model 3 is 61.7%, 50.0%, and 62.8%, respectively, demonstrating that Model 3 has a greater ability to correctly predict the model outcome (correct predictions for about 63% of the observations).

Table 2.3: Odds ratios (OR), 95% confidence intervals (95% CI), and percent concordance for diarrhea in the past two weeks. Model 1 controls for household variables, Model 2 for climatic variables, and Model 3 for all covariates.

The covariate-adjusted cluster maps for the three models are shown in Figure 2.4. The shaded areas indicate statistically significant ($p \leq 0.05$) clusters of high relative risk compared to the rest of the region. Several clusters are identical, although the risk ratios are slightly different across models. These include areas in the major cities of Dakar (Senegal), Bamako (Mali), Cotonou (Benin), and Ibadan (Nigeria) as well as larger clusters in northern Cameroon and Nigeria, southern Côte d'Ivoire, and several in Nigeria. Some clusters are larger in Models 1 and 3 than in Model 2; for example, in Burkina Faso and Ghana. Guinea and Sierra Leone do not

have any clusters in Models 1 and 2, but one straddling the two countries appears in Model 3. The highest relative risks from all the models are in Dakar (7.08), Cotonou (8.11), and north and south central Nigeria (6.03-7.23).

2.4 Discussion

This analysis first illustrates general geo-spatial patterns of diarrheal disease in West Africa without covariates and then identifies statistically significant clusters that remain after controlling for covariates to discern highrisk areas. General prevalence maps without covariates show areas of concern across the region and in particular countries, but are of limited use without adjusting for covariates or accounting for seasonal and survey method artifacts. For example, northeast Nigeria is consistently one of the most food insecure areas in West Africa, and this is reflected in the diarrhea prevalence map.[38] However, the map indicates that south

central Cameroon has a low disease burden, but the interviews in this area were conducted over 7 months from the end of the dry season to the height of the rainy season such that the effect of either season may have been cancelled by the other.

Findings from the regression modeling largely agree with previous studies. Poverty – and its links to crowding, and inadequate water, sanitation, hygiene, and housing – is well-established as a major risk factor for childhood diarrhea.[39] Linked to (but not interchangeable with) poverty is the educational attainment of the mother.[11] Worldwide, children of mothers with no education have higher rates of diarrhea than those with a secondary or higher education.[39] Here, the highest odds are for those children whose mothers have some primary education, perhaps because they are engaged in different livelihood activities that take them outside the home.

Findings in this study regarding the urban/rural divide are somewhat different than previous studies. Globally, children in rural areas have about a 10% higher prevalence of diarrhea than children in urban areas.[39] In sub-Saharan Africa, however, rapid urbanization combined with stagnant economies means that an increasing portion of urban dwellers live in slums and shantytowns.[40] Thus, the urban health advantage for children has declined in Africa as expansion of livelihood opportunities, sanitation systems, and healthcare have not kept up with urbanization rates.[40] Furthermore, urban-rural differences for childhood diarrhea and malnutrition in Africa disappear once household and community wealth are controlled.[41] In this analysis, children in urban and peri-urban areas (where slums are often located) have greater odds of diarrhea, perhaps reflecting this dynamic.

The association between the age of the child and diarrhea is similar to what is found in the literature. A worldwide study of low- and middle-income countries found incidence of diarrhea highest among children 6-

11 months and a consequent decrease toward 59 months.[12] Here, odds of diarrhea peak at 12-24 months. The youngest children (0-5 months) are protected from diarrheal pathogens as they are largely being breastfed (in this population, 96% have ever been breastfed), have limited mobility, and are under care from the mother or other household members. As babies begin to eat and drink different foods, become more mobile, and explore by putting things in their mouths, they are more exposed to pathogens and are at higher risk. The odds of diarrhea decrease after 24 months as children's immune systems develop and they gain basic hygiene skills.

In this analysis, the association between diarrheal disease and the Köppen-Geiger climate classes is statistically significant even before controlling for temperature, rainfall, or any household variables. A few health studies have used the KGCC, but a global meta-analysis found no association between diarrhea morbidity and climate class.[42] This could mean that the KGCC are more indicative at a smaller spatial scale, especially for short-term diseases such as diarrhea (compared to stunting due to chronic malnutrition, for example). In West Africa, the climate classes correlate with major livelihood activities (farming, pastoralism) which influence child nutrition and health independent of wealth or other factors.[43] Another major factor is likely a lack of access to healthcare in more remote desert areas and for transhumant populations.[44]

This research found increased odds of diarrhea associated with higher temperatures. This is consistent with the limited research in areas with climates similar to West Africa. Studies in Lima, Peru (desert climate class) and the Pacific Islands (fully humid and monsoonal) found positive associations between temperature and diarrhea hospitalizations or reports.[45-47] Again, results are more mixed outside of the tropics; a global metaanalysis found no association.[42] The mechanisms behind this association are not well-understood, but are likely linked to the biology of specific diarrheal pathogens (in West Africa, predominantly rotavirus,

enterotoxigenic *Escherichia coli*, *Shigella*, and *Cryptosporidium*) and how they survive and replicate at different temperatures.[48]

The association between rainfall and diarrheal disease does not appear to be linear, but rather u-shaped with higher risk at very low levels, lower risk at a moderate level, and higher again with very high levels. This is consistent with other short-term (weekly and monthly) studies, which find that both low and high rainfall increase diarrhea incidence.[47,49-51] Here, low rainfall implies either a normal dry season or drought conditions which can concentrate pathogens in drinking water, lead to food insecurity and malnutrition, and increase fly activity.[7,16,17] Moderate rainfall implies favorable conditions for growing crops and grazing livestock, which may improve children's nutritional status and health. Water sources are potentially plentiful, with enough recharge to dilute pathogens. Very high rainfall, however, may lead to contaminated water sources and ruin crops.[20]

The cluster analysis produced similar results for the three models, but Model 3 is the most robust and will be discussed here. Due to the spatial constraints of the data, it is not possible to fully describe the high-risk clusters; however, satellite imagery from Google Earth and anthropogenic biomes were used to further characterize them as shown in Table 2.4.[52,53] The range of increased relative risk is from 1.48 in southern Ghana to 7.21 in Kaduna, Nigeria. Ten of the 23 clusters are mostly or fully urban, indicating neighborhoods or whole cities with heightened risk. Essentially all of Dakar and Yaoundé (the largest cities in Senegal and Cameroon, respectively) have elevated risk as do parts of Bamako, Ouagadougou, Cotonou (the largest cities in Mali, Burkina Faso, and Benin), and Kaduna and Ibadan (major cities in Nigeria). Other major cities are within larger clusters, with surrounding rural areas also at elevated risk. These include Conakry, Freetown, Abidjan, Accra (the largest cities in Guinea, Sierra Leone, Côte d'Ivoire, and Ghana) and Bobo Dioulasso (Burkina Faso's

second city). However, not all major cities are at higher risk compared to the study area as a whole, including Lagos (Nigeria) - the region's megacity with 13 million inhabitants and extensive slum areas.

These clusters may have specific additional risk factors at the community level not included in the analysis. For example, the small cluster in Cotonou includes a large market and is located adjacent to a man-made canal which separates a lagoon from the ocean. This could pose risks with regards to excessive garbage and fly activity, overcrowding and insufficient public toilets, and flooding from the canal.

The other 13 clusters are largely villages surrounded by croplands (cultivated land), rangelands (land used for grazing livestock), or forests. Factors which were not included in the analysis that may contribute to elevated risk include food insecurity and inadequate healthcare. The cluster in northern Nigeria and Cameroon may be associated with conflict and drought in the area during the time of the surveys (2011-2013). In Nigeria, fighting between the radical Islamic groups Boko Haram and Ansaru and the government has severely disrupted agricultural productivity and led to food insecurity.[54] Additionally, the insurgency is marked by disruptions to the educational system, so that young mothers may have fewer resources to care for their children.[55] Also during this period, there was a drought in Cameroon, which contributed to food insecurity, reduced hygiene, and several cholera outbreaks.[56]

No.	Location	Description	Cluster Radius (km)	RR
1	Dakar (Senegal)	Urban	20	4.79
2	Southwestern Guinea and northern Sierra Leone	Villages and croplands bordered by Conakry and Freetown	117	1.98

Table 2.4: Descriptions and radii of statistically significant ($p \leq 0.05$) clusters of high relative risk (RR) of diarrhea within the study area, controlling for household and climatic characteristics (Model 3).

2.5 Conclusion

In this study, the geo-spatial distribution of diarrhea in children under five years old across West Africa during the period 2008-2013 was studied in two ways. First, a prevalence map with unadjusted rates was created. Secondly, spatial clusters of diarrheal disease were detected and those with statistically significant elevated risk compared to the rest of the study area were mapped. The cluster analysis required observed cases and expected cases, which were the covariate-adjusted predicted values obtained through logistic regression.

Overall, unadjusted prevalence rates range from 0% to 75%, but with differences both between and within countries. Benin had the lowest prevalence overall (6.0%) and 90% of sampling points had a prevalence of 15% or lower. Senegal had the highest prevalence overall (19.6%) and only 45% of sampling points had a prevalence of 15% or lower. Intra-country variation is seen in the example of Nigeria, where the poorer North East Zone had unadjusted diarrhea rates of 17.8% compared to the rest of the country (6.9%).

The logistic regression analysis showed that odds of diarrhea among children were increased and significant with increased poverty, household size, among children whose mothers had little education, and among toddlers age 12 to 23 months. The child's age and the mother's education had the highest effects. Compared to children aged 24-59 months, the odds of diarrhea for children aged 12-23 months were 2.38 (95% CI 2.272.51). Compared to children whose mothers had a post-secondary education, the odds of diarrhea for children with mothers with only a primary education were 2.13 (95% CI 1.73-2.61). This indicates the importance of resources and knowledge to combat diarrheal disease; for example that a family knows the importance of clean water, can afford it, and ensures the youngest members of the household are prioritized for its use. In this analysis, children in urban areas are on average more at risk than their rural counterparts, which indicates that there is an urban disadvantage in this part of Africa. Odds of diarrhea were increased and significant as climate zones grew progressively drier, *ceteris paribus*, which speaks to the presence of other unobserved factors such as food security, in the harsh Sahelian climate. Diarrhea odds increased with increasing temperatures, perhaps a result of pathogen survival and replication. Children in environments where there was moderate rainfall had lower odds of diarrhea than those in both very dry areas and very wet areas, demonstrating how diarrhea pathogens can become concentrated with low rainfall, and can spread through water and sanitation systems with high rainfall.

After adjusting for household and climatic factors, statistically significant clusters of high relative risk compared to the rest of the study area were seen in major cities (e.g., Dakar, Yaoundé, Bamako), but not necessarily in those cities with known large wealth inequities. For example, Lagos and Douala are among the most inequitable cities in the developing world - Lagos has a Gini index of 0.64 (where 0 is perfect income distribution equality and 1 is perfect inequality) – but neither city shows particularly elevated risk of diarrhea, *ceteris paribus*.[57] This indicates that there are unobserved factors which influence whether a city is salubrious or detrimental to child health; for example, crowding or failed municipal infrastructure systems and services

(sewage, garbage collection). Other clusters are seen in largely rural areas, where children are often more exposed to unprotected water sources and food insecurity. Increased risk was greatest in urban areas (7.16 in Cotonou, Benin; 7.21 in Kaduna, Nigeria), but substantial throughout the study area (over 2 in 18 out of 23 clusters).

These results largely agree with the original hypotheses. However, the effect of temperature was stronger than anticipated, perhaps indicating the presence of particular pathogens or their concentration in water sources. Additionally, there were more clusters of elevated risk in urban areas than were expected, again speaking to the question of urban advantage as a global phenomenon.

The findings from this research support on-going development goals which aim to improve modifiable factors including increased coverage of improved water sources and sanitation facilities, increased educational attainment, and the alleviation of poverty. The results also support adaptation measures, which are aimed at factors that are difficult to change in themselves, such as living in areas where temperatures are increasing or rainfall is decreasing. Recent climate models project intense warming in West Africa; 3 to 6°C by 2099 with significant changes by 2030 in some parts of the region.[58] Inter-model variation makes rainfall more difficult to project, both in terms of magnitude and direction (drier or wetter). Areas of high risk could thus become even more vulnerable unless adaptation measures tailored for urban and rural environments and at the household and community level are taken. For example, food security for farmers and pastoralists will become even more critical, while urban dwellers will require massive infrastructure improvements.

This study has several limitations including the 5-year time period. While DHS surveys are comparable and seasonal differences are somewhat accounted for with climatic variables, the region is developing rapidly and making gains in child health such that Sierra Leone in 2008 is not truly equivalent to Nigeria in 2013. These

data are also subject to bias due to the 2-week recall period for diarrheal episodes. There are also spatial constraints with this study. Sampling points are not evenly distributed and are intentionally offset so that the Voronoi polygons are broad estimates of the location of the population of interest. A change in spatial scale – for example sub-national regions rather than Voronoi polygons around sampling points – could alter the findings (this is an example of the Modifiable Areal Unit Problem, common in spatial analysis). The climate variables are at different spatial resolutions with temperature considerably coarser than rainfall.

Future research in this area could include examining interactions between household and climatic variables and at associations between these variables at different spatial and temporal (i.e., seasonal) resolutions.

2.6 Appendices

Appendix 2.1: Definitions of Köppen-Geiger climate classes found in the study area. See Kottek et al, 2006 for more detail.[28]

Designation	Köppen-Geiger Name (Abbreviation)	Temperature	Precipitation
Desert	Arid – Desert - Hot Arid (BWh)	Annual mean near-surface temperature □ 18°C	Annual accumulated precipitation ≤ 5 x dryness threshold
Steppe	Arid – Steppe - Hot Arid (BSh)	Annual mean near-surface temperature □ 18°C	Annual accumulated precipitation > 5 x dryness threshold
Savannah	Equatorial - Winter Dry (Aw)	Monthly mean temperature of coldest month □ 18°C	Precipitation in the driest month of winter is < 60 mm
Monsoonal	Equatorial – Monsoonal (Am)	Monthly mean temperature of coldest month □ 18°C	Annual accumulated precipitation □ 25 x (100 - precipitation in the driest month)
Fully Humid	Equatorial – Fully Humid (Af)	Monthly mean temperature of coldest month □ 18°C	Precipitation in the driest month is □ 60 mm

Appendix 2.2: The calculation of regional sampling weights.

As seen in equation 1, below, the country-level sample weights are provided by DHS without decimal points and are first divided by 1,000,000. The number of women of reproductive age per country is obtained from

the World Population Prospects (2010 data used as mid-point of surveys).[59] These two numbers are multiplied to obtain an inflation factor (IF). As shown in equation 2, the average IF per country is calculated by dividing the sum of IFs per country by the number of sampling points per country. In equation 3, the regional sampling weight for each sampling point is calculated by dividing the IF from equation 1 by the average IF from equation 2. Weights are the same for every observation within a sampling point so the appropriate regional-level weight is assigned to each child. The regional sampling weight calculations are performed with all observations – geocoded or not – to preserve representativeness.

1. $$IF = \left(\frac{\text{country-level sampling weight}}{1{,}000{,}000}\right)\left(\frac{\text{no. of women age 15-49 in country}}{\text{no.of women interviewed}}\right)$$

2. $$\text{Average IF per country} = \frac{\text{sum of IFs per country}}{\text{no. of sampling points per country}}$$

3. $$\text{Regional-level sampling weight} = \frac{\text{IF}}{\text{Average IF}} \text{ for each sampling point}$$

Chapter 3. Spatially Non-Stationary Associations between Childhood Diarrhea and Socio-economic, Climatic, and Environmental Risk Factors in West Africa: A Geographically Weighted Poisson Regression Approach

Abstract

Diarrheal disease is a major contributor to child morbidity and mortality in West Africa. Global models - which use all available data to estimate one average coefficient per explanatory variable for an entire study area - indicate associations between diarrhea and socio-economic, climatic, and environmental risk factors, but cannot discern whether these relationships change depending on specific location (i.e., are spatially nonstationary). In this study, both global Poisson and Geographically Weighted Poisson regression models were applied to data from ten Demographic and Health Surveys conducted in West Africa from 2008 to 2013. Results indicate that global models mask the spatial heterogeneity in the associations between diarrhea and water source, toilet type, mother's education, population density, latitude, temperature, rainfall, and altitude. Furthermore, these covariables show associations in both positive and negative directions depending on location. In certain places (e.g., western Mali) risk associated with multiple covariates were found. This analysis serves as a preliminary step in discerning places where certain factors increase and decrease relative risk for diarrheal disease and could assist with development and adaptation strategies to improve child health.

3.1 Introduction

Despite significant progress over the past 15 years, 11% of global deaths in children under five years old are attributed to diarrheal disease, making diarrhea the second biggest killer of children after pneumonia.[1] Incidence of diarrhea is highest in Africa with an average of 3.3 episodes per child-year (uncertainty range 2.1 – 5.0) compared to the global average of 2.7 (uncertainty range 2.1 – 3.2).[2]

The risk of diarrhea in children is influenced by complex and dynamic interactions of biological, behavioral, socio-economic, and environmental factors at different levels.[3] Fundamentally, diarrhea is a "disease of poverty" and is associated with a poor home environment, undernutrition, and a lack of access to essential services.[1]

The most common transmission of diarrheal pathogens is through the fecal-oral route; therefore containing human feces such that pathogens cannot reach water sources or be transmitted by flies is a key intervention.[4] Personal hygiene, especially washing one's hands with soap, also limits the transmission of diarrheal pathogens, for example during food preparation.[4]

Factors such as temperature and rainfall influence the presence and concentration of pathogens in the environment and can compromise the integrity of water and sanitation systems. Under hot, dry conditions, pathogens can become more concentrated in unprotected water sources as evaporation increases, thereby increasing the risk of disease.[5,6] During periods of high rainfall, uncontained feces may contaminate unprotected water sources with diarrheal pathogens.[7]

In low- and middle-income countries, population density and related urban/rural classifications are associated with child health. Dense settlement is often correlated with increased wealth, improved housing and access to food, health care, and education for children and their caretakers.[8] Open defecation is also less common in dense settlements.[8] However, urban dwellers tend to rely more on municipal infrastructure such as water supply and sewage systems which are not necessarily properly installed and maintained, and can increase exposure to fecal contaminants.[9]

There are many social aspects which influence knowledge, behavior, and resources to protect children from contracting diarrhea or shortening diarrheal episodes. Examples are appropriate infant and child feeding, vaccinations, and access to quality health care for early treatment.[1] One aspect which cuts across these issues is the educational attainment of the child's mother. This is associated with the risk of diarrhea because the mother is usually responsible for the child's feeding and hygiene, and is often the child's primary, and often only, source of health care.[10,11]

The associations between the risk factors discussed above and diarrheal disease have been studied at various spatial scales and with different methods. Strina *et al.* (2003) used non-spatial statistical methods to describe the magnitude and geographical distribution of enteric disease in a Brazilian city and Chaikew *et al.* (2009) used spatial methods to detect hotpots of diarrheal disease in a province of Thailand.[12,13] A specific area of interest in the study of disease is spatial non-stationarity which is when there is geographic variation in the association between the disease outcome and an explanatory variable.[14,15] Non-stationarity may be present, but not fully recognized if the aim of a study is to produce a global model, which uses all available data to estimate one average coefficient per explanatory variable for the entire study area. For example, a study of 70 countries estimated that compared to children using only surface water, access to basic water technology such as a well lowers the odds of diarrhea by 7% across the whole area with 7% in the rural areas and 12% in the urban areas.[16] While this gives a global average and basic disaggregation of effect, it is not known how access to a well would differ among different cities or in different parts of the world.

Spatial non-stationarity has been studied with several disease outcomes, including foodborne campylobacteriosis in Tennessee with socio-economic variables and waterborne leptospirosis in Trinidad with climatic and environmental variables.[17,18] A few studies have examined the stationarity of associations between risk factors and all-cause diarrhea. Carrel *et al.* (2011), found that greater tubewell density reduces the prevalence of cholera or shigellosis in Matlab, Bangladesh and that the effect of tubewell density is stationary.[19] Leyk *et al.* (2012) examined pediatric diarrheal mortality in Brazil as a function of access to water and literacy rates and found both to be non-stationary.[15]

However, we are not aware of any research that has studied spatial non-stationarity in risk factors for diarrhea across several countries, in Africa, or with explanatory variables that include socio-economic, climatic, and

environmental characteristics together. The aim of the present research is to examine whether there are any significant spatial variations in the relationship between childhood diarrhea and key socio-economic, climatic, and environmental characteristics across West Africa in the period 2008-2013. West Africa was selected as the study area because of the high burden of diarrheal disease, the availability of survey data for ten countries within a reasonable timeframe, and because the similarities and differences across these countries create a compelling area in which to study potentially non-stationary processes. For example, while these nations face similar challenges with regards to demographic pressures such as population growth and a general lack of public services, they differ in other areas such as violence and conflict, which also effect child health.[20] There is also considerable diversity in population density and climate in the region, which stretches from the sparsely populated desert to dense equatorial cities (Figure 3.1).

It is hypothesized that in global models, risk of diarrheal disease will increase with increases in percent of population with unimproved water sources and toilet types and percent of mothers with no formal education. Risk will also increase with higher latitudes (more arid climate types), temperatures, and population densities (overall urban disadvantage) and will decrease with higher rainfall. In geographically weighted models, it is hypothesized that larger-scale factors such as latitude, altitude, and population density will have spatially stationary associations with diarrheal disease (i.e., their effect will be the same across the study area). However, rainfall and temperature associations are expected to be spatially non-stationary (for example, rainfall – and the lack thereof - will have a larger effect in dry areas than in areas of moderate precipitation). Associations between diarrhea and water source, toilet type, and mother's education will be spatially stationary within countries, but spatially non-stationary between countries (for example, the percent of mothers with no formal education will have the same effect on childhood diarrhea wherever they live within a country, but because of different development levels, the association will change from country to country).

The direction of the association for socio-economic factors such as education will be as seen in the literature (less education is associated with higher diarrhea prevalence). Other factors such as rainfall and population density will show both negative and positive associations (e.g., urban advantage and urban disadvantage).

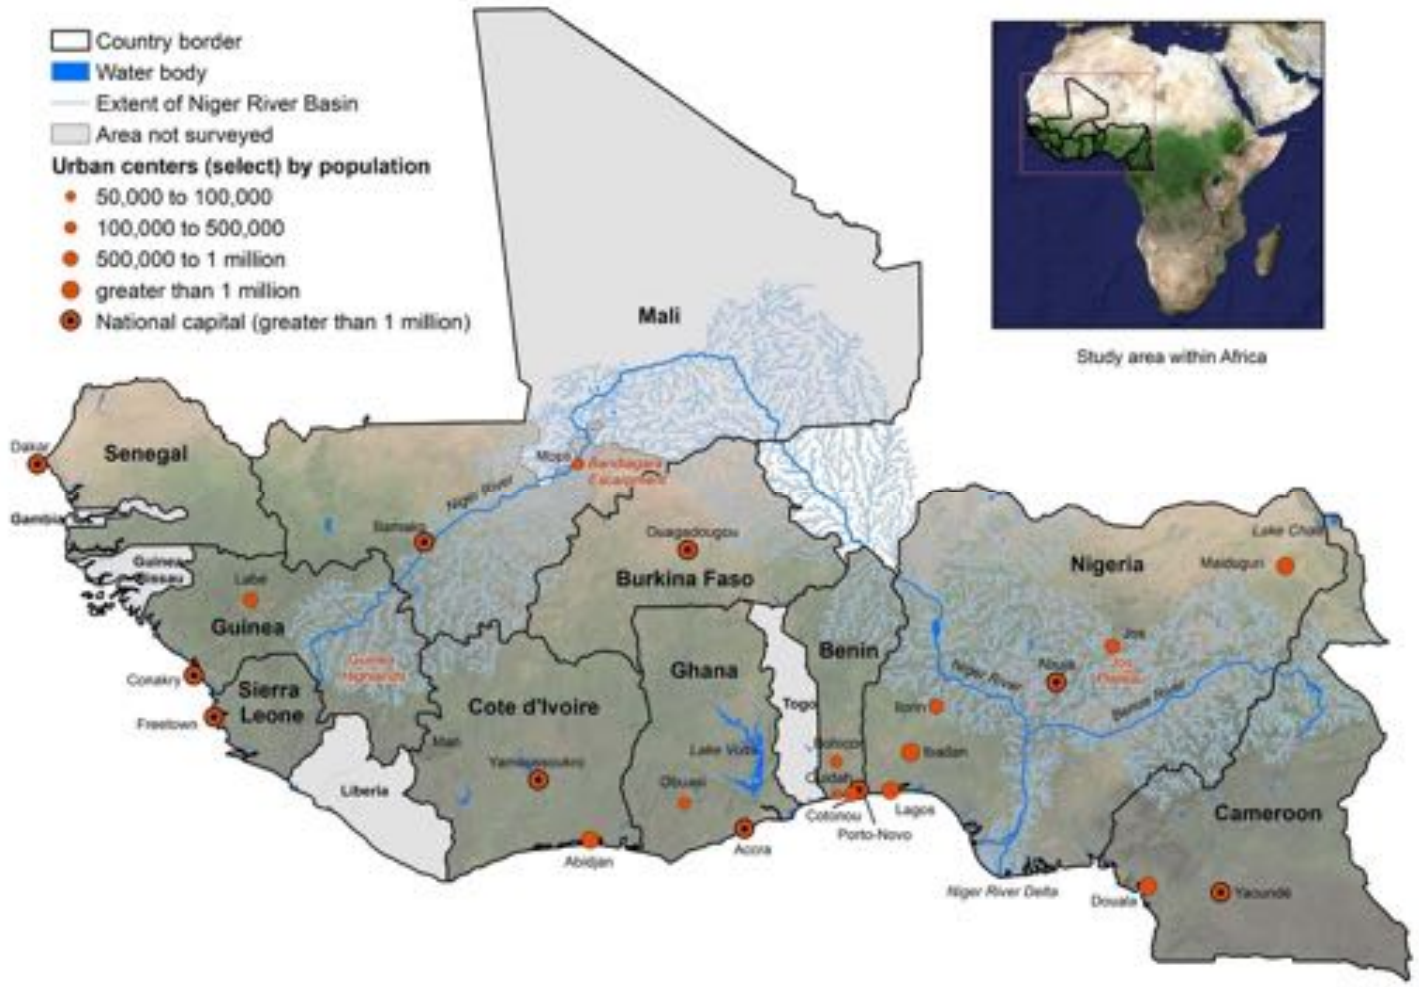

Figure 3.1: Map of the ten West African countries that make up the study area. The northern part of Mali was not included in the data source.

3.2 Methods

Data

Multiple datasets were joined for this analysis. The outcome of interest – diarrhea episodes among children under five – as well as water, sanitation, and education variables are from the Demographic and Health Surveys (DHS).[21] Climate and environmental data are derived from specialized products described below.

Demographic and Health Surveys are large, nationally representative household surveys which have been conducted in low- and middle-income countries since 1984.[21] Among the many topics covered are those related to child health; not only specific diseases, but also underlying influences such as household wealth and the vaccination status of the child. Because the surveys use similar sampling methods and questionnaires, they are considered comparable across countries and time periods.[21]

DHS uses a two-stage sampling methodology.[22] The country is first stratified by geographic (usually administrative) regions crossed with urban or rural designation.[22] In each stratum, enumeration areas determined by the most recent census are used. In the first stage, a number of primary sampling units are selected from the enumeration areas in each stratum.[22] The household lists in these areas are updated, and a fixed number of households are selected.[22] All household members within a specific group (relevant here is all women age 15-49) in the selected households are chosen for the survey.[22] Those women with children age 0-59 months are asked about the health and care of their children.[22]

Most DHS surveys are now geocoded.[21] A GPS coordinate is recorded at the approximate center of each primary sampling unit.[23] To ensure confidentiality, these sampling point coordinates are then randomly displaced 0-5 kilometers in rural areas and 0-2 kilometers in urban areas.[23] Sampling point coordinates are sometimes not collected or cannot be verified and are listed as missing.

Diarrheal disease

The outcome of interest is whether the child has had diarrhea in the past 2 weeks. Interviewers are trained to explain this means three or more loose or liquid stools per day.[24]

Water Source and Toilet Type

DHS uses the classification scheme for source of drinking water and toilet type developed by the WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation (JMP).[25] The type of water source serves as a proxy indicator for the quality of drinking water and toilet type is a proxy for adequately contained human excreta. The terms "improved" or "unimproved" are used to distinguish between the two classes. Improved and unimproved classes for water sources and toilet type are shown in Table 3.1. A few country-specific categories were reclassified to fit this scheme (e.g., "sachet water" was reclassified as procured from a water vendor).

	Improved	Unimproved
Water Source	- Piped into dwelling - Piped to yard/plot - Public tap/standpipe - Tube well or borehole - Protected dug well - Protected spring - Rainwater	- Tanker truck - Cart with small tank (water vendor) - Unprotected dug well - Unprotected spring - Surface water - Bottled water [a] - Other [b]
Toilet Type	- Flush or pour flush to piped sewer system - Flush or pour flush to septic tank - Flush or pour flush to pit latrine - Flush or pour flush to unknown place [d] - Ventilated Improved Pit latrine (VIP) - Pit latrine with slab - Composting toilet	- Flush or pour flush to somewhere else [c] - Pit latrine without slab/open pit - Hanging toilet/latrine - Bucket toilet - No facility/bush/stream - Other [b]

Table 3.1: Improved and unimproved sources of drinking water and toilet types. Notes from JMP[25] :

a) Bottled water is considered unimproved unless the household uses an improved water source for cooking and other domestic uses. This is not asked in DHS and bottled water was therefore assumed to be unimproved.
b) Unspecified responses of "Other" for both water source and toilet type were considered unimproved.
c) A flush system to "somewhere else" is classified as unimproved as it likely empties into a street or canal.

d) A flush system to "an unknown place" is considered improved because the household likely simply does not know whether it empties into a piped sewage system or a septic tank, both of which are improved.

Educational attainment of mother

Educational attainment is the highest level attended, but not necessarily finished. Although different countries have different educational systems, the variable has been standardized to include no formal education, primary education, secondary education, and higher than secondary education.[24]

Climate Class / Latitude

The Köppen-Geiger climate classification scheme (KGCC) is often used to differentiate between different climate types (e.g., equatorial), and temperature/precipitation regimes.[26] Here, latitude is used as a proxy for climate type as the software used for Geographically Weighted Poisson regression modelling does not accept categorical variables at present and the climate classes roughly follow a north-south pattern in West Africa (see Figure 3.5a).

Temperature

Temperature data was obtained from the Climatic Research Unit (CRU) time-series (TS) dataset version 3.22.[27] CRU TS3.22 is a global dataset containing several climate variables derived from weather stations and calculated on 0.5x0.5 degree grids.[27] The monthly mean temperature in the month before the interview and in the month of the interview were extracted for each observation.

For continuous raster datasets such as this, DHS recommends either point extraction or – for consistency with categorical rasters – a 5-km buffer.[23] Because the temperature rasters are considerably coarser than 5 km, point extraction was used.

Rainfall

Rainfall data are from TAMSAT (*T*ropical *A*pplications of *M*eteorology using *SAT*ellite data and ground-based observations), which is a product specifically for Africa.[28] Data on average rainfall over 10-day periods (dekads) were extracted for 3, 2, and 1 dekads before the interview and the dekad of the interview. TAMSAT is a high resolution (4 km) continuous raster dataset; therefore the average rainfall within the 5-km buffer around each sampling point was used.

Altitude

The altitude of sampling points is collected during DHS surveys. However, to ensure consistency across the region for this research, it was derived from the Shuttle Radar Topography Mission (SRTM) digital elevation models (DEM).[29] Due to computer processing constraints, point extraction rather than the average for the 5km buffer was used on this very high-resolution (< 100 m) dataset.

Population density

Population density was derived from the Gridded Population of the World (GPW), Population Density Grid Future Estimates for 2010 (the mid-point of the surveys).[30] The average within the 5-km buffer was used for this 2.5x2.5 degree grid.[30]

Analyses

Geographically Weighted Regression (GWR) and Geographically Weighted Poisson Regression (GWPR)

Traditional regression models assume that the processes accounting for the disease of interest are spatially stationary across the study area.[31] Geographically Weighted Regression (GWR) models test that assumption to determine a) whether associations vary in space, b) if they do vary, in what locations, and c) with what magnitude and direction. GWR produces two types of models: a global model which assumes spatial stationarity, and local regression models which are estimated at each location where observations were made. The local coefficients are estimated using spatially weighted observations in the neighborhood around the

sampling point (the "kernel"), the size of which is determined by a bandwidth measure.[15] If the spacing of points is irregular, an adaptive kernel type rather than a fixed distance type is preferred. With adaptive kernel types, the number of neighbors rather than the distance is fixed so that the area of the search window varies:

smaller where the points are close together and larger where they are far apart.[31] The selection of a bandwidth size is critical to the analysis, but difficult if done manually for an adaptive kernel. Small bandwidths may detect seemingly strong spatial variation in parameter estimates, but the estimates are not wholly reliable because of the small number of observations utilized. Large bandwidths use more observation points and are therefore more reliable, but they are also more biased as they are based on observations increasingly distant from the regression point of interest.[14]

As a count of a relatively rare event, diarrhea episodes are appropriately modeled through a Poisson regression model. The global Poisson regression model (equation 1) and geographically weighted Poisson regression model (equation 2) can be written as:

$$log\,(O_i / E_i) = \beta_0 + \sum_j \beta_j x_{ij} \qquad (1)$$

$$log\,(O_i / E_i) = \beta_{0,i} + \sum_j \beta_{ij} x_{ij} \qquad (2)$$

where O_i and E_i represent the number of observed and expected cases of childhood diarrhea, respectively, at sampling locations i =1…n and x_{ij} is the observed value of the j^{th} covariable at location i. For the global model, E_i is treated as the offset variable and is forced to have a regression coefficient of 1. β_0 is the common intercept and β_j are linear coefficients for the j =1 … k explanatory covariables j of sampling point i. Thus x_{ij} is

the j^{th} variable at observation *i*. For the GWPR model, the regression coefficients $\beta_{0,i}$ *and* β_{ij} are specific to each sampling point *i*, which allows for spatially varying parameters.[32]

The software GWR 4.0 (GWR4) includes three features which make it particularly useful for this study.[33] First, the selection of bandwidth size for adaptive kernels is facilitated by automated searches. In "golden section" searches, different bandwidth sizes are tested and the optimal bandwidth selected, usually determined by the AICc (small sample bias corrected Akaike Information Criterion – a measure of the relative quality of models for a specific dataset which balances the trade-offs between model fit and model complexity).[34] Second, GWR4 has the ability to fit Poisson GWR models, while other software is limited to only Gaussian models. Third, GWR4 differs from previous versions in that it can fit semi-parametric GWR models.[34] This allows the user to mix globally fixed and locally varying terms of explanatory variables in any combination in one model. The choice of which terms could be held geographically stationary is based on theory or the researcher's experience with the variable.[14]

Data preparation

To create a surface to assist with the visualization of patterns for descriptive characteristics across the study area in map form, Voronoi polygons were generated from the sampling points using ArcGIS software version 10.2.[35] Each polygon defines an area of influence (hypothetical catchment area) around its unique sampling point so that any location within the polygon is closer to that point than any other sampling point.[36]

Sample weights were normalized from the country level to the level of the study area and applied to the DHS data. These regional level weighted values are used throughout the analysis.

The data were aggregated to each sampling point with its appropriate latitude and longitude coordinates. Because variables must be continuous (i.e., not categorical) in GWR4 software, percentage for one class at a time was calculated for water source, toilet type, and educational attainment.[34] For example, the percent of mothers with no formal education is one variable and those with only a primary education is another. The other explanatory variables are continuous and are used as is.

Alternate schemes to the JMP *improved/unimproved* classes for water source and toilet type were created to test whether a different categorization better explains the associations between these variables and diarrheal disease for this particular analysis. *Untreated* water sources are surface water, unprotected and protected wells, unprotected and protected springs, and tube wells or boreholes. This is based on the hypothesis that the presence of residual chlorine from water that has presumably been treated better protects children from diarrheal pathogens all the way to point of use.[37] *Unprotected* water sources are surface water, unprotected wells, and unprotected springs. This classification aims to distinguish between the most rudimentary types of water sources and those which likely have fewer pathogens at the source and also allows for the possibility that tankered water has been treated, that water vendors use an adequate water source, and that bottled water is utilized for food preparation. *Unenclosed* flush toilet type are all JMP classes except flush or pour flush to piped sewer system or septic tank. This classification aims to separate out all but the systems which are most efficient in isolating people and vectors from fecal contaminants.

Similarly, temperature and rainfall data were summarized in various ways to test which categorization is the most relevant to diarrheal disease. For example, rainfall was averaged using different dekads to test which time period before the interview has the most effect. This is especially important because of the 2-week recall period for diarrhea episodes.

Variable selection

To select the final explanatory variables, each one was modeled in GWR4 as a univariate predictor. Those variables with the most improvement in goodness of fit between the global Poisson model and the GWPR model were selected for model building. This was determined by the difference between the global and GWR AICc within each category (e.g., rainfall). Before model building, the selected variables were checked for multicollinearity. The largest Variance Inflation Factor (VIF) was 2.07, well below the rule of thumb value of 10.[38][1]

Model building and coefficient mapping

Once the key variables were selected, six Poisson models - three of which were semi-parametric - were fitted with GWR4. Diarrhea cases were the response variable and the number of children per sampling point was the offset variable. An adaptive bi-square kernel type and golden section bandwidth search were specified. The model with the lowest AICc was determined to best explain the associations. The coefficients from a GWPR model are similar to global Poisson coefficients in that in their exponentiated form, they represent relative risk.[14] Thus, each coefficient from this final model was exponentiated and mapped (some variables were multiplied by a constant to facilitate interpretation before exponentiation). Similar to the approach introduced by Matthews and Yang (2012), only estimates with t-statistic values less than -1.645 or greater than +1.645 (indicating significance at the 0.10 level) are shown while non-significant values are masked.[39] Unlike their method, which uses one gradient from "low effect" to "high effect" without denoting that a value of 1 marks a change in direction of the association, here two gradients and a clear 1 value are used.

3.3 Results

Population description

[1] Multicollinearity was the reason why a measure of wealth was not included in this study. DHS uses a Wealth Index, which comprises several variables, including water source and toilet type. As the non-stationarity of water and sanitation variables is of particular interest to diarrheal disease, they are studied instead of wealth.

The ten DHS surveys used in this study are shown in Table 3.2. Out of a total of 117,755 observations, 1,704 (1.4%) were not geocoded as required for this study and were not included in further analysis. The geocoded and non-geocoded data have virtually identical diarrhea prevalence rates (p-value for two-tail t-test = 0.998). In Ghana, one sampling point (one mother with one child) had all missing data for key water and sanitation variables and was dropped. In the Burkina Faso and Sierra Leone surveys, respectively, two sampling points were coincident and therefore the data was combined. Thus the total number of points used in the analysis is 4,943.

No.	Country	Survey Dates	No. of Geocoded Sampling Points	No. Mothers Interviewed	No. Children Under 5
1	**Benin**	Dec 2011 - Mar 2012	746	8,897	13,043
2	**Burkina Faso**	May 2010 - Jan 2011	543	10,042	14,698
3	**Cameroon**	Jan 2011 - Aug 2011	577	7,727	11,872
4	**Côte d'Ivoire**	Dec 2011 - May 2012	341	5,023	7,170
5	**Ghana**	Sep 2008 - Nov 2008	400	2,018	2,796
6	**Guinea**	Jun 2012 - Oct 2012	300	4,977	7,042
7	**Mali**	Nov 2012 - Feb 2013	413	6,762	10,384
8	**Nigeria**	Feb 2013 - Jun 2013	889	20,277	31,545
9	**Senegal**	Oct 2010 - Apr 2011	385	7,658	11,430
10	**Sierra Leone**	Apr 2008 - Jun 2008	351	4,116	5,831
Total			**4,945**	**77,498**	**115,810**
